

**KTM**  
**Contrast sensors**

Mini, easy, speedy

## The KTM contrast sensor detects print marks quickly and reliably

Mini on the outside, fast-paced on the inside: with its fine gray-tone resolution, high detection reliability with shiny media and short response time, the KTM contrast sensor makes the process for packaging items quickly even more reliable.

### A good eye for all print marks

Whether on paper, shiny foil or other packaging materials, a SICK contrast sensor is the ideal solution wherever print marks are used to trigger a switching signal.

With 50 years' experience in the field of contrast sensors, SICK has developed into a market leader. The KTM means that the company now offers a particularly space-saving contrast sensor.

### Perfect for the packaging industry

The main application for the KTM contrast sensor is print mark control when managing packaging processes, e.g. cutting individual packaging to length from a pre-printed roll.

Another aspect is the positioning or alignment of cans, tubes, labels, and pre-printed forms.

In each case, precise detection of the print mark ensures optimum packaging and printing results.

## Small housing saves space, range of variants enables more tasks to be completed

### Easy to integrate thanks to mini housing

With a height of just 31.5 millimeters, the KTM is easy to mount even in restricted spaces.

The rugged metal inserts with internal threads permit a high tightening torque to securely fasten screws.

The sensor's high performance enables the housing to be mounted perpendicular to the medium. The intricate process of tilting the sensor to detect shiny materials is only necessary in exceptional cases.

### The right version for every application

With both the Core and Prime product families, the KTM contrast sensor covers a multitude of applications and price ranges.

The KTM Core contrast sensor offers a high level of performance for standard applications at a reasonable price – with simple manual adjustment via an integrated potentiometer. More about this version on page 6.

The high-performance KTM Prime contrast sensor is included in the range for use with more challenging applications. These contrast sensors are characterized by convenient adjustment options and an IO-Link interface. More on page 7.

## Faster production and increased packaging efficiency: the KTM with short response time

The high-performance ASIC from SICK in the KTM contrast sensor makes it possible: short response times and a high dynamic range form the basis for precise switching signals – even in challenging conditions.

### Optimum performance thanks to large dynamic range

Black and white or color, matte or shiny – with the new ASIC in the KTM contrast sensor, print marks are reliably detected on a wide range of materials.

This improved performance is particularly beneficial for shiny materials such as high-gloss foils and for low contrast levels. For example, the sensors can deal with weaker saturated print marks that arise as a result of scanning or due to the use of low-contrast and pale colors.

### High cycle for fast-moving processes

Particularly for processes that involve very high throughput speeds in packaging machinery and the graphics industry, a contrast sensor is used to transmit the required switch signals rapidly and precisely.

With a response time of 35  $\mu$ s, the KTM is the ideal solution in this respect.

It can quickly and reliably detect the signal variation when the contrast mark has been passed, therefore ensuring high positioning accuracy even at high throughput speeds.

## Optimum machine availability thanks to reliable detection of print and contrast marks

### KTM detects subtle shades

With the KTM contrast sensor, even processes demonstrating minimum differences in brightness between print or contrast marks and the background can be accomplished in a reliable manner.

In addition to differentiating between black and white, this sensor can also take a range of shades into account.

Its fine resolution of 20 gray tones guarantees that even minimum levels of contrast are detected.

This extends the application range of the mini contrast sensor to also include challenging applications.

## Performance at an affordable price: the KTM Core for standard applications

Simple manual adjustment via an integrated potentiometer and universal lighting via a white LED are the key features that characterize the Core versions of the KTM contrast sensor.

### White light for print marks of all colors

A white LED is used as a universal emitted light for the KTM Core contrast sensor.

If the contrast levels are high enough, a wide range of marks can be detected on the same background using the same switching threshold. This can generally be done by making one single setting.

The Core versions are sufficient for suitable applications and offer a high level of switching reliability at excellent value for money.

### Simple adjustment of the switching threshold using a potentiometer

When changing products or formats, the switching threshold of the Core versions can be adjusted directly at the housing – quickly and simply, without the need for tools.

### Versions of the KTM Core product family

- KTM Core KTMxxx91  
Manual adjustment of the switching threshold for when it has to be fast.
- KTM Core KTMxxx11  
Adjustment of the switching threshold using a screwdriver.

## High-performance and convenient: the KTM Prime contrast sensor

The Prime versions combine high detection reliability thanks to 3-color LED technology and high productivity thanks to remote-control teach-in, which can also be carried out while production is underway.

### RGB LED for more challenging applications

Particularly for high-gloss materials and those with low levels of contrast, the Prime versions of the KTM offer high detection reliability.

This is because the sensor has red, green, and blue emitted light LEDs and carries out a fully-automatic check during teach-in to determine which LED generates the highest contrast value for the current process. Without making any other settings, the sensor therefore always works using the optimum emitted light.

For this reason, the RGB LED is particularly suitable for any number of color combinations between marks and backgrounds.

### Teach-in with optimum efficiency

In addition to the intuitive and simple static teach-in function, all KTM Prime sensors have a further two teach-in features.

„Dynamic teach-in“ enables teach-in to take place during ongoing operation so that the material flow does not need to be interrupted. Pressing the pushbutton again moves the threshold closer to the mark.

The advantage of this is that the switching threshold does not have to constantly be re-adapted even when the background changes. Dynamic teach-in also supports remote adjustment from the operator panel.

### Change formats quickly and easily using IO-Link

With the Prime versions, format changes can be dealt with quickly and easily by retrieving the parameter settings of jobs that have already been completed from the controller's memory.

Further advantages of IO-Link include visualization of the signal quality and the output of quality characteristics to perform an advanced diagnosis.

#### Versions of the KTM Prime product family

- KTM Prime KTM-xxxx81x  
M8 plug, 4-pin. PNP or NPN.
- KTM Prime KTM-xxxxA1x  
M8 plug, 4-pin. With IO-Link. PNP or NPN.
- KTM Prime KTM-xxxx82x  
M12 cable, 4-pin. PNP or NPN.

Mini, easy, speedy

### Product description

Improved performance for universal use in the packaging industry: The KTM contrast sensor from SICK stands out thanks to its high grayscale resolution integrated in a small, established housing. The optimized OES4 ASIC technology and a response time of 35 μs ensure reliable and accurate detection of contrast differences even on shiny materials. The

various teach-in methods mean greater flexibility during commissioning. The integrated IO-Link can be used to access the parameter settings. This speeds up and simplifies format changes. The KTM reliably detects marks even in conditions with weak contrast ratios and is ideal for use in a wide range of applications.

### At a glance

- Established mini housing
- High grayscale resolution
- Increased dynamic range means reliable detection of contrasts on shiny materials
- Static and dynamic teach-in in one variant
- Switching frequency 15 kHz (type-dependent)
- KTM Core for standard applications
- KTM Prime with IO-Link function

### Your benefits

- Mini housing makes use in tight spaces possible
- Three-color LED technology allows a reliable process, with contrast marks detected even in conditions with weak contrast ratios
- Good contrast resolution and an increased dynamic range ensure good performance on shiny materials, thus increasing the range of applications in the industry
- High flexibility during commissioning thanks to various teach-in methods
- Extended diagnostics, visualization, and quick and simple format changes by downloading the parameter settings via IO-Link

## Detailed technical data

### Features

Dimensions (L x W x H)	12 mm x 31.5 mm x 21 mm
Sensing distance	12.5 mm
Sensing distance tolerance	± 3 mm
Max. web speed tech-in (dynamic) <sup>1)</sup>	1 m/s

<sup>1)</sup> At a mark size of 4 mm.

### Mechanics/electronics

Supply voltage $V_s$ <sup>1)</sup>	DC 12 V ... 24 V
Ripple <sup>2)</sup>	≤ 5 V <sub>pp</sub>
Power consumption <sup>3)</sup>	< 50 mA
Switching output	PNP: HIGH = $V_s - \leq 2 \text{ V}$ / LOW approx. 0 V NPN: HIGH = approx. $V_s$ / LOW ≤ 2 V
Output current $I_{\text{max}}$ <sup>4)</sup>	100 mA
Input, teach-in (ET)	PNP: Teach: $U = 10.8 \text{ V} \dots < V_s$ Run: $U < 2 \text{ V}$ or open NPN: Teach: $U < 2 \text{ V}$ Run: $> V_s - 2 \text{ V}$ or open
Retention time (ET)	28 ms, non-volatile memory
Protection class	III
Circuit protection	$V_s$ connections reverse-polarity protected Output Q short-circuit protected Interference suppression
Enclosure rating	IP 67
Weight	
Connector M8, 4-pin	Approx. 20 g
Cable with connector M12, 4-pin	Approx. 70 g
Housing material	ABS (plastic)

<sup>1)</sup> Extreme values: 12 V (-10 %) ... 24 V (+20 %). Operation in short-circuit protected network max. 8 A.

<sup>2)</sup> May not exceed or fall short of  $V_s$  tolerances.

<sup>3)</sup> Without load.

<sup>4)</sup> At supply voltage > 24 V,  $I_{\text{max}} = 30 \text{ mA}$ .  $I_{\text{max}}$  is consumption count of all Qn.

### Ambient data

Ambient temperature	Operation: -10 °C ... +55 °C Storage: -20 °C ... +75 °C
Shock load	According to IEC 60068
UL File-No.	UL No. NRKH.E348498

## Specific data

Light source <sup>1)</sup>	Light spot direction <sup>3)</sup>	Light spot size	Switching frequency <sup>4)</sup>	Response time <sup>5)</sup>	Type	Ordering information
LED white	–	2 mm x 2 mm	10 kHz	50 µs	KTM Core	10
LED red, green, blue <sup>2)</sup>	Vertical	1.5 mm x 6.5 mm	15 kHz	35 µs	KTM Prime	10
LED white	–	2 mm x 2 mm	15 kHz	35 µs		

<sup>1)</sup> Average service life of 100,000 h at T<sub>A</sub> = +25 °C .

<sup>2)</sup> Wave length: 470 nm, 525 nm, 625 nm.

<sup>3)</sup> In relation to long side of housing.

<sup>4)</sup> With light/dark ratio 1:1.

<sup>5)</sup> Signal transit time with resistive load.

### Sensing distance

## Setting the switching threshold via potentiometer

For example dark switching

### 1. Position background

Start at "+" (right-hinged).  
Turn potentiometer in direction "-" until the yellow LED goes out.

### 2. Position mark

Yellow LED lights up.  
Continue to turn the potentiometer in direction "-" until the yellow LED goes out again.

### 3. Set switching threshold

Turn between positions 1 and 2, to ensure that the switching threshold is optimally set.

### Switching characteristics

The switching threshold is set in the center between the background and the mark.

Light switching: yellow LED ≠ switching output Q

Dark switching: yellow LED = switching output Q

Light/dark switching selectable by means of rotary switch

KTM-MB31111P: potentiometer can be adjusted with a screwdriver

KTM-MB31191P: potentiometer can be adjusted with a screwdriver or by hand

## Setting the switching threshold via teach-in (static 2-point teach-in)

### 1. Position mark

Press and hold teach-in button > 1 < 3 s.  
Yellow LED flashes slowly.

### 2. Position background

Press and hold teach-in button < 3 s.  
Yellow LED goes out.

## Setting the switching threshold via teach-in (dynamic)

### 1. Position background

Press the teach-in button and keep it pressed. LED flashing slowly.

### 2. Move at least the mark and background using the light spot.

Keep the teach-in button > 3 < 30 s pressed.

Release the teach-in button.

Yellow LED will illuminate, when emitted light is on the mark.

### Example

### Switching characteristics

The optimum emitted light is selected automatically (at RGB variants).

Static teach-in: light/dark setting is defined using teach-in sequence.

Dynamic teach-in: switching output active on mark, if background is longer in the field of view during the teach-in.

The switching threshold is set in the center between the background and the mark.

If the button is pressed again within 10 s of the teach ( $> 20 \text{ ms} < 10 \text{ s}$ ),

the switching threshold is placed 25 % below the mark (dotted line in Figure).

Teach-in can also be performed using an external control signal (only dynamic teach-in).

Keylock activation and deactivation: hold down teach-in button  $> 30 \text{ s}$ .

Teach-in failure: yellow LED indicator and the transmitted light of the sensor flashing quickly.

For dynamic teach-in with ET signal (5 Hz) via switching output Q.

## For safety and productivity: SICK LifeTime Services

SICK LifeTime Services is a comprehensive set of high-quality services provided to support the entire life cycle of products and applications from system design all the way to upgrades. These services increase the safety of people, boost the productivity of machines and serve as the basis for our customers’ sustainable business success.

**Consulting & Design**

Globally available experts for cost-effective solutions

**Product & System Support**

Fast and reliable, by telephone or on location

**Verification & Optimization**

Checks and recommendations for increased availability

**Upgrade & Retrofits**

Uncovers new potential for machines and systems

**Training & Education**

Employee qualification for increased competitiveness

## SICK at a glance

### Leading technologies

With a staff of more than 6,000 and over 40 subsidiaries and representations worldwide, SICK is one of the leading and most successful manufacturers of sensor technology. The power of innovation and solution competency have made SICK the global market leader. No matter what the project and industry may be, talking with an expert from SICK will provide you with an ideal basis for your plans – there is no need to settle for anything less than the best.

### Unique product range

- Non-contact detecting, counting, classifying, positioning and measuring of any type of object or media
- Accident and operator protection with sensors, safety software and services
- Automatic identification with bar code and RFID readers
- Laser measurement technology for detecting the volume, position and contour of people and objects
- Complete system solutions for analysis and flow measurement of gases and liquids

### Comprehensive services

- SICK LifeTime Services – for safety and productivity
- Application centers in Europe, Asia and North America for the development of system solutions under real-world conditions
- E-Business Partner Portal [www.mysick.com](http://www.mysick.com) – price and availability of products, requests for quotation and online orders
