

# 12-W, 3.3/5-V INPUT, WIDE OUTPUT ADJUSTABLE BOOST CONVERTER

 Check for Samples: [PTN04050C](#)

## FEATURES

- Up to 12 W Output Power
- Wide Input Voltage Range (2.95 V to 5.5 V)
- Wide Output Voltage Adjust (5 V to 15 V)
- High Efficiency (Up to 90%)
- Operating Temperature:  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$
- Surface Mount Package Available

## APPLICATIONS

- Telecommunications, Instrumentation, and General-Purpose Applications

## DESCRIPTION

The PTN04050C is a 4-pin boost-voltage regulator product. In new designs it should be considered in place of the PT5040 series of positive step-up products. The PTN04050C is smaller and lighter than its predecessors, and has either similar or improved electrical performance characteristics. The case-less, double-sided package, also exhibits improved thermal characteristics, and is compatible with TI's roadmap for RoHS and lead-free compliance.

Operating over a 2.95V to 5.5V input range, the PTN04050C provides high-efficiency, step-up voltage conversion for loads of up to 12W. The output voltage is set using a single external resistor. The PTN04050C may be set to any value within the range, 5V to 15V. The output voltage of the PTN04050C can be as little as 0.5V higher than the input, allowing an output voltage of 5V, with an input voltage of 4.5V.

The PTN04050C modules are suited to a wide variety of general-purpose applications that operate off 3.3-V or 5-V dc power.

\* See the *Application Information* section for capacitor recommendations.

# See the *Application Information* section for  $R_{SET}$  values.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum at the end of this datasheet, or see the TI website at [www.ti.com](http://www.ti.com).

### ABSOLUTE MAXIMUM RATINGS <sup>(1)</sup>

over operating free-air temperature range unless otherwise noted  
all voltages with respect to GND (pin 1),

			UNIT
$T_A$	Operating free-air temperature	Over $V_I$ range	–40°C to 85°C
	Leaded temperature (H suffix)	5 seconds	260°C <sup>(2)</sup>
	Solder reflow temperature (S suffix)	Surface temperature of module body or pins	235°C
	Solder reflow temperature (Z suffix) <sup>(3)</sup>	Surface temperature of module body or pins	260°C <sup>(3)</sup>
$T_{stg}$	Storage temperature		–55°C to 125°C
$P_O$	Output power		12 W

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.  
 (2) This model is NOT compatible with surface-mount reflow solder process.  
 (3) Moisture Sensitivity Level (MSL) Rating Level-3-260C-168HR

### RECOMMENDED OPERATING CONDITIONS

		MIN	MAX	UNIT
$V_I$	Input voltage	2.95	5.5	V
$T_A$	Operating free-air temperature	–40	85	°C

### PACKAGE SPECIFICATIONS

PTN04050Cx (Suffix AH, AS, and AZ)			
Weight			2.8 grams
Flammability	Meets UL 94 V-O		
Mechanical shock	Per Mil-STD-883D, Method 2002.3, 1 ms, 1/2 sine, mounted		500 G <sup>(1)</sup>
Mechanical vibration	Mil-STD-883D, Method 2007.2, 20-2000 Hz	Horizontal T/H (suffix AH)	20 G <sup>(1)</sup>
		Horizontal SMD (suffix AS and AZ)	15 G <sup>(1)</sup>

- (1) Qualification limit.

## ELECTRICAL CHARACTERISTICS

 operating at 25°C free-air temperature,  $V_I = 5\text{ V}$ ,  $V_O = 12\text{ V}$ ,  $I_O = I_O(\text{max})$ ,  $C_I = 100\text{ }\mu\text{F}$ ,  $C_O = 100\text{ }\mu\text{F}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS		PTN04050C

- (1) Operation at no load is not recommended.
- (2) The maximum  $V_I$  is 5.5V or  $(V_O - 0.5\text{V})$  whichever is less. If the difference in  $V_O$  to  $V_{\text{IN}}$  is  $\geq 0.5\text{V}$  and  $\leq 1.4\text{V}$ , the device will operate in asynchronous mode. In this condition, there may be multiple output voltage ripple frequencies and the total output voltage variation may increase by up to 2%.
- (3) The set-point voltage tolerance is affected by the tolerance and stability of  $R_{\text{SET}}$ . The stated limit is unconditionally met if  $R_{\text{SET}}$  has a tolerance of 1% with 100 ppm/ $^\circ\text{C}$  or better temperature stability.
- (4) Boost-topology switching regulators are not short-circuit protected.
- (5) The inrush current stated is in addition to the normal input current for the associated output load.
- (6) An external input capacitor is required across the input ( $V_I$  and GND) for proper operation. See the application information for further guidance.
- (7) An external output capacitance is required for proper operation. See the application information for further guidance.
- (8) The minimum ESR limitation may result in a lower value for the output capacitance. See the application information for further guidance.
- (9) When using ceramic capacitors equivalent to 100  $\mu\text{F}$ , a 100  $\mu\text{F}$  bulk electrolytic is also required.
- (10) This is the minimum ESR for all the electrolytic (nonceramic) output capacitance. Use 17 m $\Omega$  as the minimum when using maximum ESR values to calculate.

**PIN ASSIGNMENT****PIN FUNCTIONS**

PIN		I/O	DESCRIPTION
NAME	NO.		
GND	1	I/O	This is the common ground connection for the $V_I$ and $V_O$ power connections. It is also the $0 V_{dc}$ reference for the $V_O$ Adjust control input.
$V_I$	2	I	The positive input voltage power node to the module, which is referenced to common GND.
$V_O$ Adjust	3	I	A 1% resistor must be connected between this pin and GND (pin 1) to set the output voltage. If left open-circuit, the output voltage will default to its minimum adjust value. The temperature stability of the resistor should be 100 ppm/°C (or better). The set-point range is 5 V to 15 V. The standard resistor value for a number of common output voltages is provided in the application information.
$V_O$	4	O	The regulated positive power output with respect to the GND node.

## APPLICATION INFORMATION

### Adjusting the Output Voltage of the PTN04050C Wide-Output Adjust Power Modules

#### General

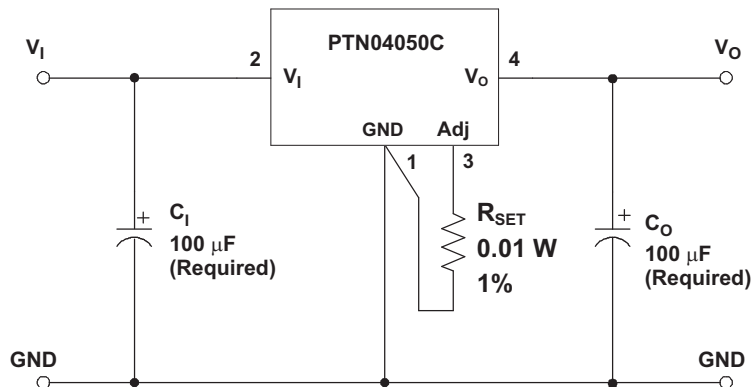

A resistor must be connected between the  $V_O$  Adjust control (pin 3) and GND (pin 1) to set the output voltage of the PTN04050C product. The adjustment range is from 5 V to 15 V. If pin 3 is left open, the output voltage defaults to the lowest value.

Table 1 gives the standard resistor value for several common voltages, along with the actual output voltage that the value provides. For other output voltages, the value of the required resistor can be calculated using Equation 1. Alternatively,  $R_{SET}$  can be simply selected from the range of values given in Table 2. Figure 14 shows the placement of the required resistor.

$$R_{SET} = 15 \text{ k}\Omega \times \frac{2 \text{ V}}{V_O - 5 \text{ V}} - 2.94 \text{ k}\Omega \quad (1)$$

**Table 1. Standard Values of  $R_{SET}$  for Common Output Voltages**

$V_O$ (Required)	$R_{SET}$ (Standard Value)	$V_O$ (Actual)
5.0 V	Open	5.00 V
9.0 V	4.53 k $\Omega$	9.01 V
12.0 V	1.33 k $\Omega$	12.03 V
15.0 V	60.4 $\Omega$	14.99 V

- (1) A 0.05-W rated resistor may be used. The tolerance should be 1%, with a temperature stability of 100 ppm/°C (or better). Place the resistor as close to the regulator as possible. Connect the resistor directly between pins 3 and 1 using dedicated PCB traces.
- (2) Never connect capacitors from  $V_O$  Adjust to GND or  $V_O$ . Any capacitance added to the  $V_O$  Adjust pin affects the stability of the regulator.

**Figure 14. PTN04050C  $V_O$  Adjust Resistor Placement**

**Table 2. PTN04050C Output Voltage Set-Point Resistor Values**

$V_O$	$R_{SET}$	$V_O$	$R_{SET}$	$V_O$	$R_{SET}$
5 V	Open	10 V	3.06 k $\Omega$	12.6 V	1.01 k $\Omega$

9.6 V	3.58 k $\Omega$	12.3 V	1.17 k $\Omega$	14.9 V	90 $\Omega$
9.8 V	3.31 k $\Omega$	12.4 V	1.11 k $\Omega$	15 V	60 $\Omega$
9.9 V	3.18 k $\Omega$	12.5 V	1.06 k $\Omega$		

## CAPACITOR RECOMMENDATIONS FOR PTN04050C WIDE-OUTPUT ADJUST POWER MODULES

### Input Capacitor

The minimum required input capacitance is 100  $\mu\text{F}$ . The minimum ripple current rating for any nonceramic capacitance must be greater than 250 mA rms. The ripple current rating of electrolytic capacitors is a major consideration when they are used at the input. This ripple current requirement can be reduced by placing ceramic capacitors at the input, in addition to the minimum required capacitance.

When specifying regular tantalum capacitors for use at the input, a minimum voltage rating of 2 X (maximum dc voltage + ac ripple) is highly recommended. This is standard practice to ensure reliability. Polymer-tantalum capacitors are not affected by this requirement. (Please verify voltage derating for the polymer-tantalum capacitors from the vendors.)

### Output Capacitor

The minimum capacitance required to insure stability is a 100  $\mu\text{F}$ . A combination of both ceramic and electrolytic-type capacitors should be used. The minimum ripple current rating for the nonceramic capacitance must be at least 150 mA rms. When using ceramic capacitors equivalent to 100  $\mu\text{F}$ , a 100  $\mu\text{F}$  bulk electrolytic is also required. The stability of the module and voltage tolerances are compromised if the capacitor is not placed near the output pin. A high-quality, computer-grade electrolytic capacitor is adequate. Ceramic capacitance should also be located within 0.5 inches (1.27 cm) of the output pin.

For applications with load transients (sudden changes in load current), the regulator response improves with additional capacitance. Additional electrolytic capacitors should be located close to the load circuit. These capacitors provide decoupling over the frequency range, 2 kHz to 150 kHz. Aluminum electrolytic capacitors are suitable for ambient temperatures above 0°C. For operation below 0°C, tantalum or OS-CON type capacitors are recommended. When using one or more nonceramic capacitors, the calculated equivalent ESR should be no lower than 10 m $\Omega$  (17 m $\Omega$  using the manufacturer's maximum ESR for a single capacitor). A list of capacitors and vendors are identified in [Table 3](#), the recommended capacitor table.

### Ceramic Capacitors

Above 150 kHz the performance of aluminum electrolytic capacitors becomes less effective. To further reduce the reflected input ripple current, or the output transient response, multilayer ceramic capacitors must be added. Ceramic capacitors have low ESR and their resonant frequency is higher than the bandwidth of the regulator. When placed at the output, their combined ESR is not critical as long as the total value of ceramic capacitance does not exceed 100  $\mu\text{F}$ .

*Note: If only ceramics are used on the output bus, then a 100  $\mu\text{F}$  electrolytic is required for stabilization.*

### Tantalum Capacitors

Tantalum type capacitors may be used at the output, and are recommended for applications where the ambient operating temperature can be less than 0°C. The AVX TPS, Sprague 593D/594/595, and Kemet T495/T510/T520 capacitors series are suggested over many other tantalum types due to their rated surge, power dissipation, and ripple current capability. As a caution, many general-purpose tantalum capacitors have considerably higher ESR, reduced power dissipation, and lower ripple current capability. These capacitors are also less reliable as they have lower power dissipation and surge current ratings. Tantalum capacitors that do not have a stated ESR or surge current rating are not recommended for power applications. When specifying OS-CON and polymer tantalum capacitors for the output, the minimum ESR limit is encountered well before the maximum capacitance value is reached.

### Capacitor Table

The capacitor table, [Table 3](#), identifies the characteristics of capacitors from various vendors with acceptable ESR and ripple current (rms) ratings. The recommended number of capacitors required at both the input and output buses is identified for each capacitor type. This is not an extensive capacitor list. Capacitors from other vendors are available with comparable specifications. Those listed are for guidance. The rms current rating and ESR (at 100 kHz) are critical parameters necessary to insure both optimum regulator performance and long capacitor life.

## Designing for Load Transients

The transient response of the dc/dc converter has been characterized using a load transient with a di/dt of 1 A/ $\mu$ s. The typical voltage deviation for this load transient is given in the data sheet specification table using the required value of output capacitance. As the di/dt of a transient is increased, the response of a converter's regulation circuit ultimately depends on its output capacitor decoupling network. This is an inherent limitation of any dc/dc converter once the speed of the transient exceeds its bandwidth capability. If the target application specifies a higher di/dt or lower voltage deviation, the requirement can only be met with additional output capacitor decoupling. In these cases, special attention must be paid to the type, value, and ESR of the capacitors selected.

If the transient performance requirements exceed those specified in the data sheet, the selection of output capacitors becomes more important. Obey the minimum ESR and maximum capacitance limits specified in the Electrical Characteristics table.

**Table 3. Recommended Input/Output Capacitors <sup>(1)</sup>**

### (1) Capacitor Supplier Verification

1. Verify availability of capacitors identified in this table. Capacitor suppliers may recommend alternative part numbers because of limited availability or obsolete products. In some instances, the capacitor product life cycle may be in decline and have short-term consideration for obsolescence.

#### RoHS, Lead-free and Material Details

2. Consult capacitor suppliers regarding material composition, RoHS status, lead-free status, and manufacturing process requirements. Component designators or part number deviations may occur if material composition or soldering requirements change.

(2) The maximum voltage rating of the capacitor must be selected for the desired set-point voltage ( $V_O$ ). To operate at a higher output voltage, select a capacitor with a higher voltage rating.

## Power-Up Characteristics

When configured per the standard application, the PTN04050C power module produces a regulated output voltage following the application of a valid input source voltage. During power up, internal soft-start circuitry slows the rate that the output voltage rises, thereby limiting the amount of in-rush current drawn from the input source. Figure 15 shows the power-up waveforms for a PTN04050C, operating from a 5-V input and with the output voltage adjusted to 12 V. The waveforms were measured with a 1-A resistive load.

Figure 15. Power-Up Waveforms

## Overtemperature Protection

A thermal shutdown mechanism protects the module's internal circuitry against excessively high temperatures. A rise in temperature may be the result of a drop in airflow, a high ambient temperature, or a sustained overcurrent condition. If the junction temperature of the internal control IC rises excessively, the module turns its boost operation off. Although the module is off, an output voltage of approximately ( $V_I - 300$  mV) is still present. The module restarts boost operation when the sensed temperature decreases by approximately 10 degrees.

**Note:** *Overtemperature protection is a last resort mechanism to prevent damage to the module. It should not be relied on as permanent protection against thermal stress. Always operate the module within its temperature derated limits, for the worst-case operating conditions of output current, ambient temperature, and airflow. Operating the module above these limits, albeit below the thermal shutdown temperature, reduces the long-term reliability of the module.*

## Boost Topology

With boost regulators an output voltage of approximately ( $V_I - 300\text{ mV}$ ) is present whenever the input voltage to the module is below the minimum input voltage range, or during an overtemperature condition. Also, a boost regulator cannot provide inherent short-circuit protection. This is due to the fact that there is a dc path from the input to the output even when the PWM and FET are not operating. This is shown in the boost topology diagram in Figure 16.

Figure 16. Typical Boost Converter Topology

## Optional Input/Output Filters

Power modules include internal input and output ceramic capacitors in all their designs. However, some applications require much lower levels of either input reflected or output ripple/noise. This section describes various filters and design techniques found to be successful in reducing both input and output ripple/noise.

### Input/Output Capacitors

A first step toward reducing output ripple and noise is to add one or more 22- $\mu\text{F}$  ceramic capacitors, such as C4 shown in Figure 17. Ceramic capacitors should be placed close to the output power terminals. A single 22- $\mu\text{F}$  capacitor reduces the output ripple/noise by 10% to 30% for modules with a rated output current of less than 3 A. (Note: C3 is recommended to improve the regulators transient response and does not reduce output ripple and noise.)

Switching regulators draw current from the input line in pulses at their operating frequency. The amount of reflected (input) ripple/noise generated is directly proportional to the equivalent source impedance of the power source including the impedance of any input lines. The addition of C1, minimum 22- $\mu\text{F}$  ceramic capacitor, near the input power pins, reduces reflected conducted ripple/noise by 30% to 50%.

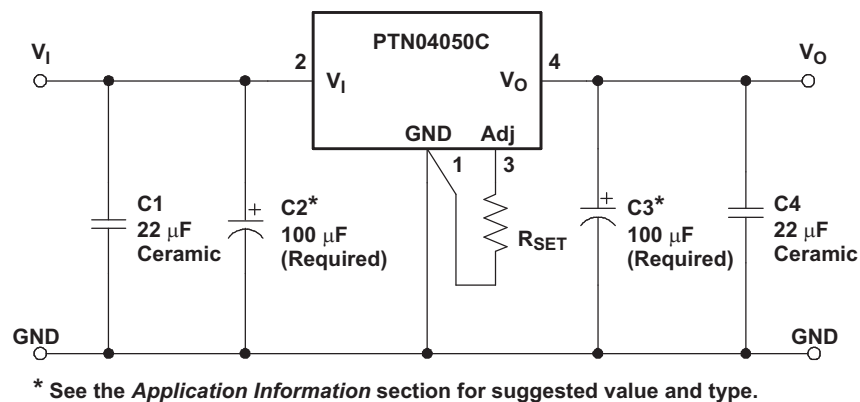

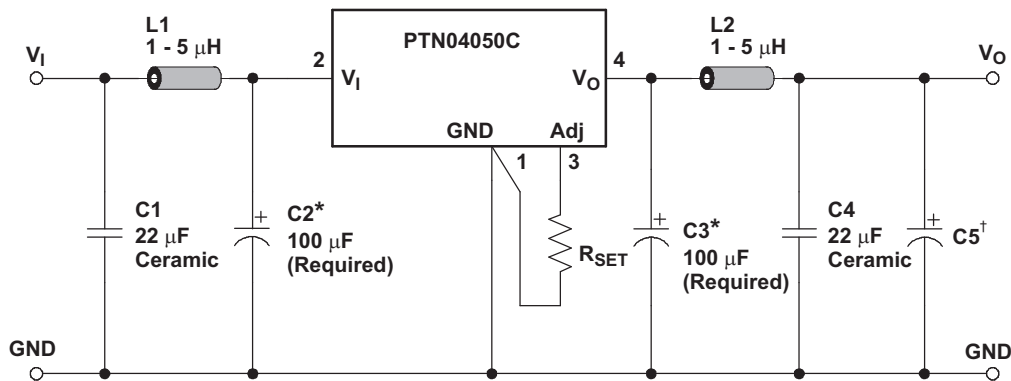

Figure 17. Adding High-Frequency Bypass Capacitors To The Input and Output

**π Filters**

If a further reduction in ripple/noise level is required for an application, higher order filters must be used. A π (pi) filter, employing a ferrite bead (Fair-Rite Part Number 2673000701 or equivalent) in series with the input or output terminals of the regulator reduces the ripple/noise by at least 20 db (see Figure 18 and Figure 19). In order for the inductor to be effective in reduction of ripple and noise, ceramic capacitors are required. (Note: for additional information on vendors and component suggestions, see the capacitor recommendations for the PTN04050C.)

These inductors plus ceramic capacitors form an excellent filter because of the rejection at the switching frequency (650 kHz - 1 MHz). The placement of this filter is critical. It must be located as close as possible to the input or output pins to be effective. The ferrite bead is small (12,5 mm X 3 mm) and has low dc resistance. Fair-Rite also manufactures a surface-mount bead (Part No. 2773021447), through hole (Part Number 2673000701) rated to 5 A. Inductors in the range of 1 μH to 5 μH can be used in place of the ferrite inductor bead.

\* See the *Application Information* section for suggested value and type.  
 † Recommended for applications with load transients.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

  - I. All pins: Material – Copper Alloy  
Finish – Tin (100%) over Nickel plate  
Solder Ball – See product data sheet.
  - J. Dimension prior to reflow solder.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
