

# L6226Q

### DMOS dual full bridge driver

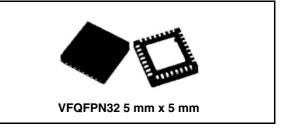

### Features

- Operating supply voltage from 8 to 52 V
- 2.8 A output peak current (1.4 A DC)
- R<sub>DS(on)</sub> 0.73 Ω typ. value @ T<sub>J</sub> = 25 °C
- Operating frequency up to 100 kHz
- Programmable high side overcurrent detection and protection
- Diagnostic output
- Paralleled operation
- Cross conduction protection
- Thermal shutdown
- Under voltage lockout
- Integrated fast free wheeling diodes

### **Applications**

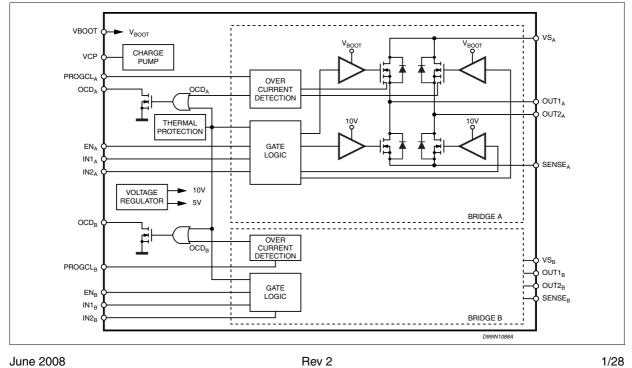

- Bipolar stepper motor
- Dual or quad DC motor

#### Figure 1. Block diagram

### Description

The L6226Q is a DMOS dual full bridge designed for motor control applications, realized in BCDmultipower technology, which combines isolated DMOS power transistors with CMOS and bipolar circuits on the same chip. Available in QFN32 5x5 package, the L6226Q features thermal shutdown and a non-dissipative overcurrent detection on the high side power MOSFETs plus a diagnostic output that can be easily used to implement the overcurrent protection.

### 4 **Circuit description**

#### 4.1 **Power stages and charge pump**

The L6226Q integrates two independent power MOS full bridges. Each power MOS has an  $R_{DS(on)} = 0.73 \ \Omega$  (typical value @ 25 °C), with intrinsic fast freewheeling diode. Cross conduction protection is achieved using a dead time (td = 1  $\mu$ s typical) between the switch off and switch on of two power MOS in one leg of a bridge.

Using N-channel power MOS for the upper transistors in the bridge requires a gate drive voltage above the power supply voltage. The bootstrapped (VBOOT) supply is obtained through an internal oscillator and few external components to realize a charge pump circuit as shown in *Figure 3*. The oscillator output (VCP) is a square wave at 600 kHz (typical) with 10 V amplitude. Recommended values/part numbers for the charge pump circuit are shown in *Table 6*.

Component	Value

### 4.2 Logic inputs

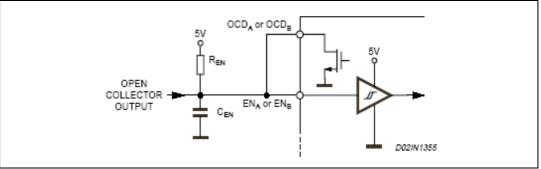

Pins  $IN1_A$ ,  $IN2_A$ ,  $IN1_B$ ,  $IN2_B$ ,  $EN_A$  and  $EN_B$  are TTL/CMOS and microcontroller compatible logic inputs. The internal structure is shown in *Figure 4*. Typical value for turn-on and turn-off thresholds are respectively Vthon = 1.8 V and Vthoff = 1.3 V.

Pins EN<sub>A</sub> and EN<sub>B</sub> are commonly used to implement overcurrent and thermal protection by connecting them respectively to the outputs OCD<sub>A</sub> and OCD<sub>B</sub>, which are open-drain outputs. If that type of connection is chosen, some care needs to be taken in driving these pins. Two configurations are shown in *Figure 5* and *Figure 6*. If driven by an open drain (collector) structure, a pull-up resistor R<sub>EN</sub> and a capacitor C<sub>EN</sub> are connected as shown in *Figure 5*. If the driver is a standard push-pull structure the resistor R<sub>EN</sub> and the capacitor C<sub>EN</sub> are connected as shown in *Figure 6*. The resistor R<sub>EN</sub> should be chosen in the range from 2.2 k $\Omega$  to 180 k $\Omega$ . Recommended values for R<sub>EN</sub> and C<sub>EN</sub> are respectively 100 k $\Omega$  and 5.6 nF. More information on selecting the values is found in the overcurrent protection section.

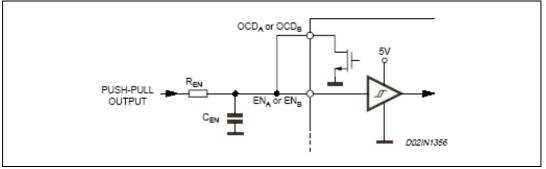

#### Figure 6. EN<sub>A</sub> and EN<sub>B</sub> pins push-pull driving

### 4.3 Truth table

Inputs		Outputs

Н	Н	L	Vs	GND
Н	L	Н	GND	Vs
Н	Н	Н	Vs	Vs

1. X = Don't care

2. High Z = High impedance output

### 4.4 Non-dissipative overcurrent detection and protection

An overcurrent detection circuit (OCD) is integrated. This circuit can be used to provides protection against a short circuit to ground or between two phases of the bridge as well as a roughly regulation of the load current. With this internal over current detection, the external current sense resistor normally used and its associated power dissipation are eliminated. *Figure 7* shows a simplified schematic of the overcurrent detection circuit for the bridge A. bridge B is provided of an analogous circuit.

To implement the over current detection, a sensing element that delivers a small but precise fraction of the output current is implemented with each high side power MOS. Since this current is a small fraction of the output current there is very little additional power dissipation. This current is compared with an internal reference current  $I_{\text{REF}}$  When the output current reaches the detection threshold Isover the OCD comparator signals a fault condition. When a fault condition is detected, an internal open drain MOS with a pull down capability of 4 mA connected to OCD pin is turned on. *Figure 8* shows the OCD operation.

This signal can be used to regulate the output current simply by connecting the OCD pin to EN pin and adding an external R-C as shown in *Figure 7*. The off time before recovering normal operation can be easily programmed by means of the accurate thresholds of the logic inputs.

 ${\sf I}_{\sf REF}$  and, therefore, the output current detection threshold are selectable by  ${\sf R}_{\sf CL}$  value, following the equations:

- Isover = 2.8 A  $\pm$  30 % at -25 °C < T<sub>J</sub> < 125 °C if R<sub>CL</sub> = 0  $\Omega$  (PROGCL connected to GND)
- Isover =  $\frac{11050}{R_{CL}}$  ±10 % at -25 °C < T<sub>J</sub> < 125 °C if 5 k $\Omega$  < R<sub>CL</sub> < 40 k $\Omega$

Figure 9 shows the output current protection threshold versus  $R_{CL}$  value in the range 5 k $\Omega$  to 40 k $\Omega$ .

The disable time  $t_{\text{DISABLE}}$  before recovering normal operation can be easily programmed by means of the accurate thresholds of the logic inputs. It is affected whether by  $C_{\text{EN}}$  and  $R_{\text{EN}}$ 

57

values and its magnitude is reported in *Figure 10*. The delay time  $t_{DELAY}$  before turning off the bridge when an overcurrent has been detected depends only by  $C_{EN}$  value. Its magnitude is reported in *Figure 11*.

 $C_{EN}$  is also used for providing immunity to pin EN against fast transient noises. Therefore the value of  $C_{EN}$  should be chosen as big as possible according to the maximum tolerable Delay Time and the  $R_{EN}$  value should be chosen according to the desired Disable Time.

The resistor R<sub>EN</sub> should be chosen in the range from 2.2 k $\Omega$  to 180 k $\Omega$ . Recommended values for R<sub>EN</sub> and C<sub>EN</sub> are respectively 100 k $\Omega$  and 5.6 nF that allow obtaining 200  $\mu s$  disable time.

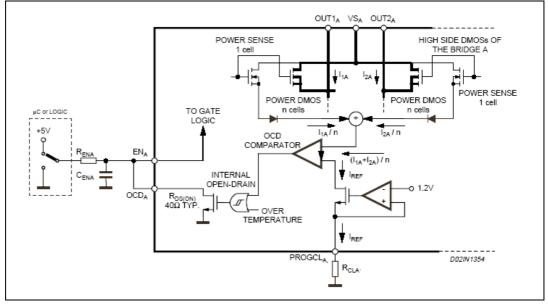

Figure 7. Overcurrent protection simplified schematic

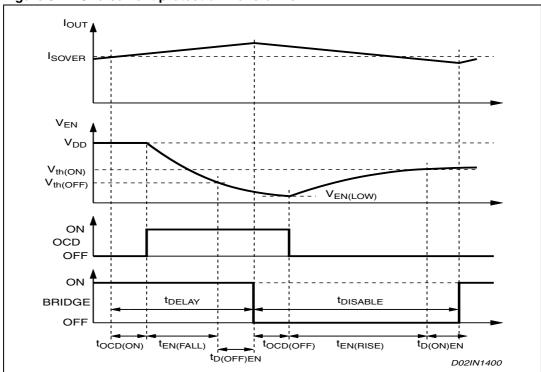

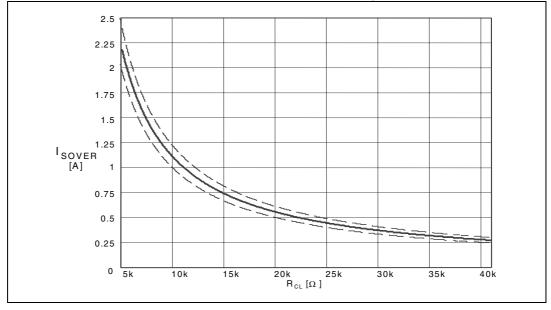

Figure 8. Overcurrent protection waveforms

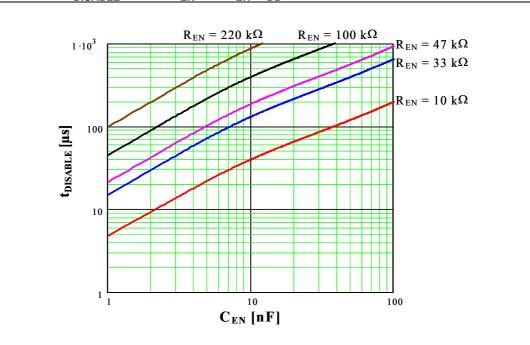

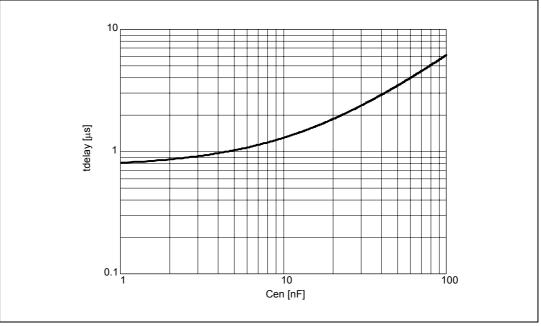

Figure 10.  $t_{DISABLE}$  versus  $C_{EN}$  and  $R_{EN}$  ( $V_{DD}$  = 5 V)

### 4.5 Thermal protection

In addition to the ovecurrent detection, the L6226Q integrates a thermal protection for preventing the device destruction in case of junction over temperature. It works sensing the die temperature by means of a sensible element integrated in the die. The device switch-off when the junction temperature reaches 165 °C (typ. value) with 15 °C hysteresis (typ. value).

## 5 Application information

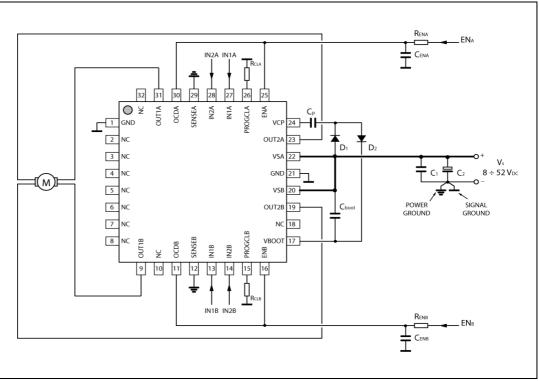

A typical application using L6226Q is shown in *Figure 12*. Typical component values for the application are shown in *Table 8*. A high quality ceramic capacitor in the range of 100 to 200 nF should be placed between the power pins (VS<sub>A</sub> and VS<sub>B</sub>) and ground near the L6226Q to improve the high frequency filtering on the power supply and reduce high frequency transients generated by the switching. The capacitors connected from the EN<sub>A</sub>/OCD<sub>A</sub> and EN<sub>B</sub>/OCD<sub>B</sub> nodes to ground set the shut down time for the bridge A and bridge B respectively when an over current is detected (see overcurrent protection). The two current sources (SENSE<sub>A</sub> and SENSE<sub>B</sub>) should be connected to power ground with a trace length as short as possible in the layout. To increase noise immunity, unused logic pins are best connected to 5 V (high logic level) or GND (low logic level) (see pin description). It is recommended to keep power ground and Signal Ground separated on PCB.

### 6 Paralleled operation

The outputs of the L6226Q can be paralleled to increase the output current capability or reduce the power dissipation in the device at a given current level. It must be noted, however, that the internal wire bond connections from the die to the power or sense pins of the package must carry current in both of the associated half bridges. When the two halves of one full bridge (for example  $OUT1_A$  and  $OUT2_A$ ) are connected in parallel, the peak current rating is not increased since the total current must still flow through one bond wire on the power supply or sense pin. In addition the over current detection senses the sum of the current in the upper devices of each bridge (A or B) so connecting the two halves of one bridge in parallel does not increase the over current detection threshold.

For most applications the recommended configuration is half bridge 1 of bridge A paralleled with the half bridge 1 of the bridge B, and the same for the half bridges 2 as shown in *Figure 13.* The current in the two devices connected in parallel will share very well since the R<sub>DS(on)</sub> of the devices on the same die is well matched.

When connected in this configuration the over current detection circuit, which senses the current in each bridge (A and B), will sense the current in upper devices connected in parallel independently and the sense circuit with the lowest threshold will trip first. With the enables connected in parallel, the first detection of an over current in either upper DMOS device will turn of both bridges. Assuming that the two DMOS devices share the current equally, the resulting over current detection threshold will be twice the minimum threshold set by the resistors  $R_{CLA}$  or  $R_{CLB}$  in *Figure 13*. It is recommended to use  $R_{CLA} = R_{CLB}$ .

In this configuration the resulting bridge has the following characteristics.

- Equivalent device: full bridge
- R<sub>DS(on)</sub> 0.37 Ω typ. value @ T<sub>J</sub> = 25 °C
- 2.8 A max RMS load current
- 5.6 A max OCD threshold

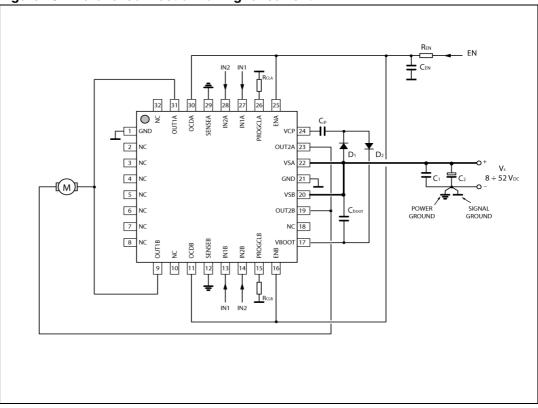

Figure 13. Parallel connection for higher current

To operate the device in parallel and maintain a lower over current threshold, half bridge 1 and the half bridge 2 of the bridge A can be connected in parallel and the same done for the bridge B as shown in *Figure 14*. In this configuration, the peak current for each half bridge is still limited by the bond wires for the supply and sense pins so the dissipation in the device will be reduced, but the peak current rating is not increased.

When connected in this configuration the over current detection circuit, senses the sum of the current in upper devices connected in parallel. With the enables connected in parallel, an over current will turn of both bridges. Since the circuit senses the total current in the upper devices, the over current threshold is equal to the threshold set the resistor  $R_{CLA}$  or  $R_{CLB}$  in *Figure 14*.  $R_{CLA}$  sets the threshold when outputs OUT1<sub>A</sub> and OUT2<sub>A</sub> are high and resistor  $R_{CLB}$  sets the threshold when outputs OUT1<sub>B</sub> and OUT2<sub>B</sub> are high. It is recommended to use  $R_{CLA} = R_{CLB}$ .

In this configuration, the resulting bridge has the following characteristics.

- Equivalent device: FULL BRIDGE
- R<sub>DS(on)</sub> 0.37 Ω typ. value @ T<sub>J</sub> = 25 °C
- 1.4 A max RMS load current
- 2.8 A max OCD threshold

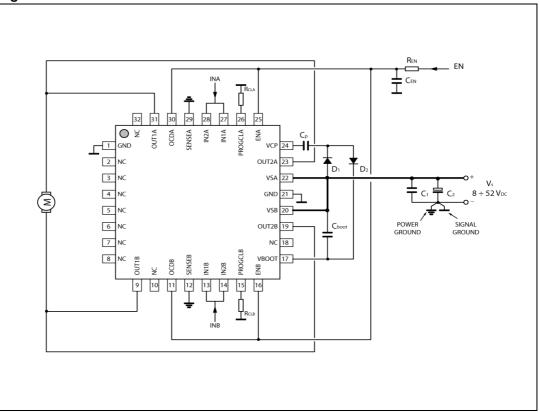

Figure 14. Parallel connection with lower overcurrent threshold

It is also possible to parallel the four half bridges to obtain a simple half bridge as shown in *Figure 15.* In this configuration the, the over current threshold is equal to twice the minimum threshold set by the resistors  $R_{CLA}$  or  $R_{CLB}$  in *Figure 15.* It is recommended to use  $R_{CLA} = R_{CLB}$ .

The resulting half bridge has the following characteristics.

- Equivalent device: half bridge
- R<sub>DS(on)</sub> 0.18 Ω typ. value @ T<sub>J</sub> = 25 °C
- 2.8 A max RMS load current
- 5.6 A max OCD threshold

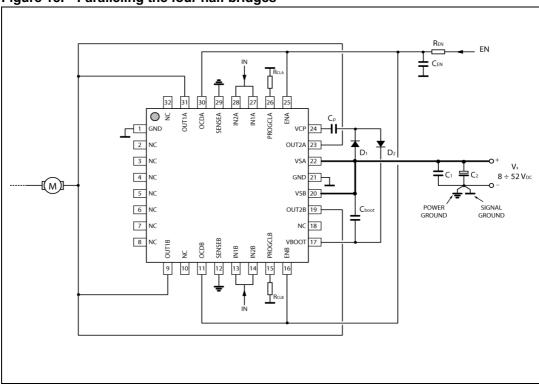

Figure 15. Paralleling the four half bridges

### 7 Output current capability and IC power dissipation

In *Figure 16* and *Figure 17* are shown the approximate relation between the output current and the IC power dissipation using PWM current control driving two loads, for two different driving types:

- One full bridge ON at a time (*Figure 16*) in which only one load at a time is energized.
- Two full bridges ON at the same time (*Figure 17*) in which two loads at the same time are energized.

For a given output current and driving type the power dissipated by the IC can be easily evaluated, in order to establish which package should be used and how large must be the on-board copper dissipating area to guarantee a safe operating junction temperature (125 °C maximum).

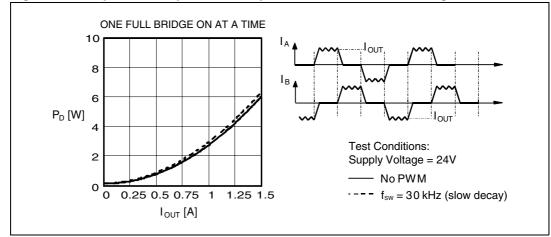

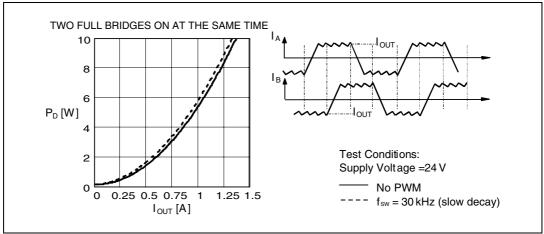

Figure 16. IC power dissipation vs output current with one full bridge ON at a time

Figure 17. IC power dissipation vs output current with two full bridges ON at the same time

### 8 Thermal management

In most applications the power dissipation in the IC is the main factor that sets the maximum current that can be deliver by the device in a safe operating condition. Therefore, it has to be taken into account very carefully. Besides the available space on the PCB, the right package should be chosen considering the power dissipation. Heat sinking can be achieved using copper on the PCB with proper area and thickness. For instance, using a VFQFPN32L 5x5 package the typical  $R_{th(JA)}$  is about 22 °C/W when mounted on a double-layer FR4 PCB with a dissipating copper surface of 0.5 cm<sup>2</sup> on the top side plus 6 cm<sup>2</sup> ground layer connected through 18 via holes (9 below the IC).

## 9 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com

Dim.	Databook (mm)		
	Min	Тур	Мах
А	0.80	0.85	0.95
b	0.18	0.25	0.30
b1	0.165	0.175	0.185
D	4.85	5.00	5.15
D2	3.00	3.10	3.20
D3	1.10	1.20	1.30
E	4.85	5.00	5.15
E2	4.20	4.30	4.40
E3	0.60	0.70	0.80
е		0.50	
L	0.30	0.40	0.50
ddd			0.08

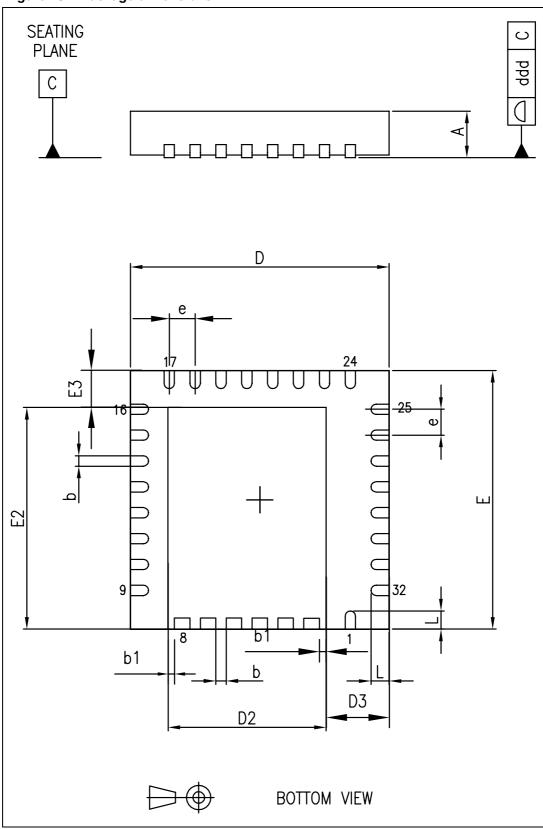

Table 9. VFQFPN32 5x5x1.0 pitch 0.50

Note: 1 VFQFPN stands for thermally enhanced very thin profile fine pitch quad flat package no lead. Very thin profile: 0.80 < A = 1.00 mm.

2 Details of terminal 1 are optional but must be located on the top surface of the package by using either a mold or marked features.
