20-W DIGITAL AUDIO-POWER AMPLIFIER WITH EQ, DRC, AND 2.1 MODE

Check for Samples: TAS5711

FEATURES

- **Audio Input/Output**
  - **20-W Into an 8-Ω Load From an 18-V Supply**
  - **Wide PVDD Range, From 8 V to 26 V**
  - **Efficient Class-D Operation Eliminates Need for Heatsinks**
  - **One Serial Audio Input (Two Audio Channels)**
  - **2.1 Mode (2 SE + 1 BTL)**
  - **2.0 Mode (2 BTL)**
  - **Single-Filter PBTL Mode Support**
  - **I^2C Address Selection Pin (Chip Select)**
  - **Supports 8-kHz to 48-kHz Sample Rate (LJ/RJ/I^2S)**
- **Audio/PWM Processing**
  - **Independent Channel Volume Controls With 24-dB to Mute**
  - **Separate Dynamic Range Control for Satellite and Subchannels**
  - **21 Programmable Biquads for Speaker EQ and Other Audio Processing Features**
  - **Programmable Coefficients for DRC Filters**
  - **DC Blocking Filters**
  - **Support for 3D Effects**
- **General Features**
  - **Serial Control Interface Operational Without MCLK**
  - **Factory-Trimmed Internal Oscillator for Automatic Rate Detection**
  - **Surface Mount, 48-Pin, 7-mm × 7-mm HTQFP Package**
  - **Thermal and Short-Circuit Protection**
  - **Support for AD or BD Mode**
- **Benefits**
  - **Up to 90% Efficient**
  - **AD and BD Filter Mode Support**
  - **SNR: 106 dB, A-Weighted**
  - **EQ: Speaker Equalization Improves Audio Performance**
  - **DRC: Dynamic Range Compression. Can Be Used As Power Limiter. Enables Speaker Protection, Easy Listening, Night-Mode Listening.**
  - **Separate DRC for Satellite and Subchannels**
  - **Autobank Switching: Preload Coefficients for Different Sample Rates. No Need to Write new Coefficients to the Part When Sample Rate Changes.**
  - **Autodetect: Automatically Detects Sample-Rate Changes. No Need for External Microprocessor Intervention**
- **Requires Only 3.3 V and PVDD**

APPLICATIONS

- **Television**
- **iPod™ Dock**
- **Sound Bar**

DESCRIPTION

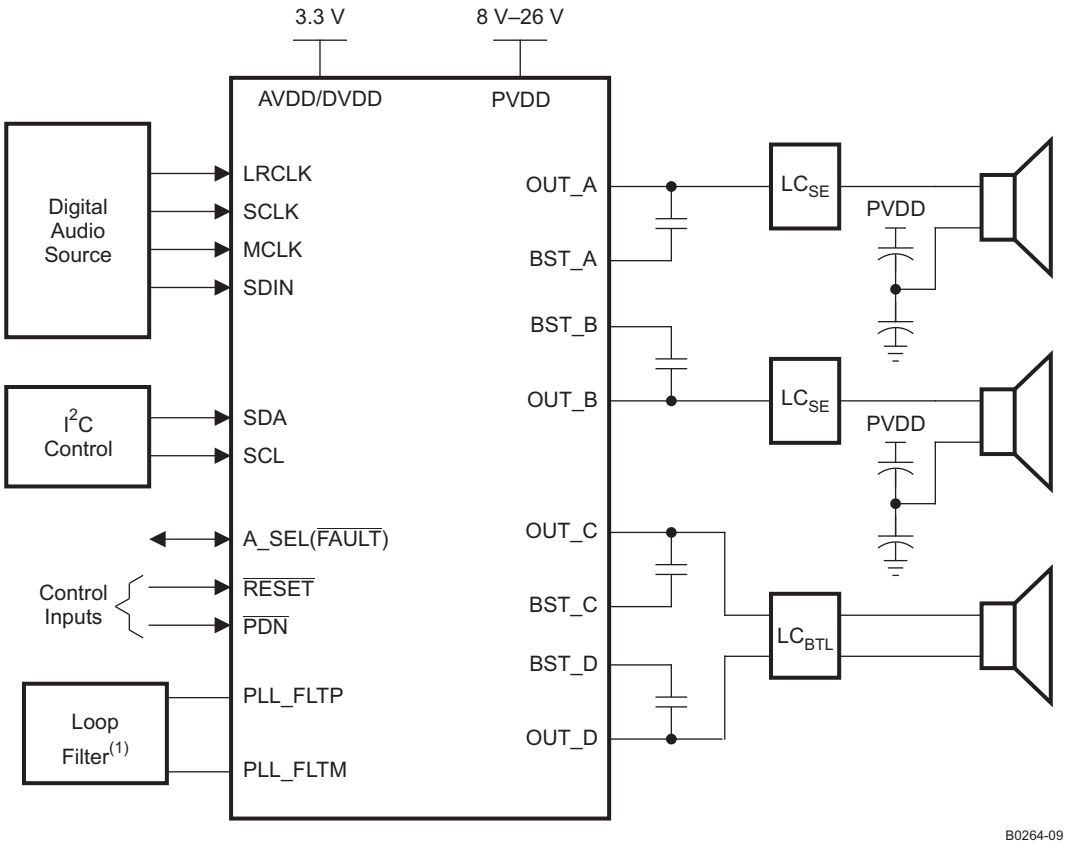
The TAS5711 is a 20-W, efficient, digital audio power amplifier for driving stereo bridge-tied speakers. One serial data input allows processing of up to two discrete audio channels and seamless integration to most digital audio processors and MPEG decoders. The device accepts a wide range of input data and data rates. A fully programmable data path routes these channels to the internal speaker drivers.

The TAS5711 is an I^2S slave-only device receiving all clocks from external sources. The TAS5711 operates with a PWM carrier between 384-kHz switching rate and 352-KHz switching rate depending on the input sample rate. Oversampling combined with a fourth-order noise shaper provides a flat noise floor and excellent dynamic range from 20 Hz to 20 kHz.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

SIMPLIFIED APPLICATION DIAGRAM



(1) See TAS5711 EVM User's Guide (SLOU280) for loop filter values.

PIN FUNCTIONS

PIN		TYPE[1]	5-V TOLERANT	TERMINATION[2]	DESCRIPTION
NAME	NO.				
AGND	30	P			Analog ground for power stage
A_SEL	14	DIO			A value of 0 (15-kΩ pulldown) makes the I²C device address 0x34, and a value of 1 (15-kΩ pullup) makes it 0x36. This pin can be programmed after RESET to be an output by writing 1 to bit 0 of I²C register 0x05. In that mode, the A_SEL pin is redefined as FAULT (see ERROR REPORTING for details).
AVDD	13	P			3.3-V analog power supply
AVSS	9	P			Analog 3.3-V supply ground
BST_A	4	P			High-side bootstrap supply for half-bridge A
BST_B	43	P			High-side bootstrap supply for half-bridge B
BST_C	42	P			High-side bootstrap supply for half-bridge C
BST_D	33	P			High-side bootstrap supply for half-bridge D
DVDD	27	P			3.3-V digital power supply
DVSSO	17	P			Oscillator ground

(1) TYPE: A = analog; D = 3.3-V digital; P = power/ground/decoupling; I = input; O = output
(2) All pullups are weak pullups and all pulldowns are weak pulldowns. The pullups and pulldowns are included to assure proper input logic levels if the pins are left unconnected (pullups → logic 1 input; pulldowns → logic 0 input).

PIN FUNCTIONS (continued)

PIN		TYPE[1]	5-V TOLERANT	TERMINATION[2]	DESCRIPTION
NAME	NO.				
DVSS	28	P			Digital ground
GND	29	P			Analog ground for power stage
GVDD_OUT	5, 32	P			Gate drive internal regulator output. This pin must not be used to drive external devices.
LRCLK	20	DI	5-V	Pulldown	Input serial audio data left/right clock (sample rate clock)
MCLK	15	DI	5-V	Pulldown	Master clock input
OC_ADJ	7	AO			Analog overcurrent programming. Requires resistor to ground.
OSC_RES	16	AO			Oscillator trim resistor. Connect an 18.2-kΩ 1% resistor to DVSSO.
OUT_A	1	O			Output, half-bridge A
OUT_B	46	O			Output, half-bridge B
OUT_C	39	O			Output, half-bridge C
OUT_D	36	O			Output, half-bridge D
PBTL	8	DI			Low means BTL or SE mode; high means PBTL mode. Information goes directly to power stage.
$\overline{\text{PDN}}$	19	DI	5-V	Pullup	Power down, active-low. $\overline{\text{PDN}}$ prepares the device for loss of power supplies by shutting down the Noise Shaper and initiating PWM stop sequence.
PGND_AB	47, 48	P			Power ground for half-bridges A and B
PGND_CD	37, 38	P			Power ground for half-bridges C and D
PLL_FLTM	10	AO			PLL negative loop filter terminal
PLL_FLTP	11	AO			PLL positive loop filter terminal
PVDD_A	2, 3	P			Power supply input for half-bridge output A
PVDD_B	44, 45	P			Power supply input for half-bridge output B
PVDD_C	40, 41	P			Power supply input for half-bridge output C
PVDD_D	34, 35	P			Power supply input for half-bridge output D
$\overline{\text{RESET}}$	25	DI	5-V	Pullup	Reset, active-low. A system reset is generated by applying a logic low to this pin. $\overline{\text{RESET}}$ is an asynchronous control signal that restores the DAP to its default conditions, and places the PWM in the hard mute state (tristated).
SCL	24	DI	5-V		I^2C serial control clock input
SCLK	21	DI	5-V	Pulldown	Serial audio data clock (shift clock). SCLK is the serial audio port input data bit clock.
SDA	23	DIO	5-V		I^2C serial control data interface input/output
SDIN	22	DI	5-V	Pulldown	Serial audio data input. SDIN supports three discrete (stereo) data formats.
SSTIMER	6	AI			Controls ramp time of OUT_x to minimize pop. Leave this pin floating for BD mode. Requires capacitor of 2.2 nF to GND in AD mode. The capacitor determines the ramp time.
STEST	26	DI			Factory test pin. Connect directly to DVSS.
VR_ANA	12	P			Internally regulated 1.8-V analog supply voltage. This pin must not be used to power external devices.
VR_DIG	18	P			Internally regulated 1.8-V digital supply voltage. This pin must not be used to power external devices.
VREG	31	P			Digital regulator output. Not to be used for powering external circuitry.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) (1)

		VALUE	UNIT
Supply voltage	DVDD, AVDD	–0.3 to 3.6	V
	PVDD_x	–0.3 to 30	V
Input voltage	OC_ADJ	–0.3 to 4.2	V
	3.3-V digital input	–0.5 to DVDD + 0.5	V
	5-V tolerant(2) digital input (except MCLK)	–0.5 to DVDD + 2.5(3)	V
	5-V tolerant MCLK input	–0.5 to AVDD + 2.5(3)	V
OUT_x to PGND_x		32(4)	V
BST_x to PGND_x		43(4)	V
Input clamp current, I_{IK}		±20	mA
Output clamp current, I_{OK}		±20	mA
Operating free-air temperature		0 to 85	°C
Operating junction temperature range		0 to 150	°C
Storage temperature range, T_{stg}		–40 to 125	°C

(1) Stresses beyond those listed under *absolute ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operation conditions* are not implied. Exposure to absolute-maximum conditions for extended periods may affect device reliability.
(2) 5-V tolerant inputs are $\overline{PDN}$, $\overline{RESET}$, SCLK, LRCLK, MCLK, SDIN, SDA, and SCL.
(3) Maximum pin voltage should not exceed 6.0V
(4) DC voltage + peak ac waveform measured at the pin should be below the allowed limit for all conditions.

DISSIPATION RATINGS(1)

PACKAGE	DERATING FACTOR ABOVE T_A = 25°C	$T_A \le$ 25°C POWER RATING	T_A = 45°C POWER RATING	T_A = 70°C POWER RATING
7-mm × 7-mm HTQFP	40 mW/°C	5 W	4.2 W	3.2 W

(1) This data was taken using 1 oz trace and copper pad that is soldered directly to a JEDEC standard high-k PCB. The thermal pad must be soldered to a thermal land on the printed-circuit board. See TI Technical Briefs SLMA002 for more information about using the HTQFP thermal pad

RECOMMENDED OPERATING CONDITIONS

			MIN	NOM	MAX	UNIT
	Digital/analog supply voltage	DVDD, AVDD	3	3.3	3.6	V
	Half-bridge supply voltage	PVDD_x	8		26	V
V_{IH}	High-level input voltage	5-V tolerant	2			V
V_{IL}	Low-level input voltage	5-V tolerant			0.8	V
T_A	Operating ambient temperature range		0		85	°C
T_J (1)	Operating junction temperature range		0		125	°C
R_L (BTL)	Load impedance	Output filter: L = 15 µH, C = 680 nF.	6	8		Ω
L_O (BTL)	Output-filter inductance	Minimum output inductance under short-circuit condition	10			µH

(1) Continuous operation above the recommended junction temperature may result in reduced reliability and/or lifetime of the device.

PWM OPERATION AT RECOMMENDED OPERATING CONDITIONS

PARAMETER	TEST CONDITIONS	VALUE	UNIT
Output sample rate	11.025/22.05/44.1-kHz data rate ±2%	352.8	kHz
	48/24/12/8/16/32-kHz data rate ±2%	384	

PLL INPUT PARAMETERS AND EXTERNAL FILTER COMPONENTS

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{MCLKI}	MCLK Frequency		2.8224		24.576	MHz
	MCLK duty cycle		40%	50%	60%	
tr / $tf_{(MCLK)}$	Rise/fall time for MCLK				5	ns
	LRCLK allowable drift before LRCLK reset				4	MCLKs
	External PLL filter capacitor C1	SMD 0603 X7R		47		nF
	External PLL filter capacitor C2	SMD 0603 X7R		4.7		nF
	External PLL filter resistor R	SMD 0603, metal film		470		Ω

ELECTRICAL CHARACTERISTICS

DC Characteristics

TA = 25°, PVCC_x = 18V, DVDD = AVDD = 3.3V, R_L= 8Ω, BTL AD Mode, FS = 48KHz (unless otherwise noted)

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{OH}	High-level output voltage	$\overline{A\_SEL}$ and SDA	I_{OH} = –4 mA DVDD = AVDD = 3 V	2.4			V
V_{OL}	Low-level output voltage	$\overline{A\_SEL}$ and SDA	I_{OL} = 4 mA DVDD = AVDD = 3 V			0.5	V
I_{IL}	Low-level input current		$V_I < V_{IL}$; DVDD = AVDD = 3.6V			75	µA
I_{IH}	High-level input current		$V_I > V_{IH}$; DVDD = AVDD = 3.6V			75(1)	µA
I_{DD}	3.3 V supply current	3.3 V supply voltage (DVDD, AVDD)	Normal Mode		48	70	mA
			Reset ($\overline{RESET}$ = low, $\overline{PDN}$ = high)		24	32	
I_{PVDD}	Half-bridge supply current	No load (PVDD_x)	Normal Mode		30	55	mA
			Reset ($\overline{RESET}$ = low, $\overline{PDN}$ = high)		5	13	
$r_{DS(on)}$ (2)	Drain-to-source resistance, LS	T_J = 25°C, includes metallization resistance			180		mΩ
	Drain-to-source resistance, HS	T_J = 25°C, includes metallization resistance			180		
I/O Protection							
V_{uvp}	Undervoltage protection limit	PVDD falling			7.2		V
$V_{uvp,hyst}$	Undervoltage protection limit	PVDD rising			7.6		V
OTE(3)	Overtemperature error				150		°C
OTE_{HYST} (3)	Extra temperature drop required to recover from error				30		°C
OLPC	Overload protection counter	f_{PWM} = 384 kHz			0.63		ms
I_{OC}	Overcurrent limit protection	Resistor—programmable, max. current, R_{OCP} = 22 kΩ			4.5		A
I_{OCT}	Overcurrent response time				150		ns
R_{OCP}	OC programming resistor range	Resistor tolerance = 5% for typical value; the minimum resistance should not be less than 20 kΩ.	20	22			kΩ
R_{PD}	Internal pulldown resistor at the output of each half-bridge	Connected when drivers are tristated to provide bootstrap capacitor charge.			3		kΩ

(1) I_{IH} for the PBTL pin has a maximum limit of 200 µA due to an intenal pulldown on the pin.
(2) This does not include bond-wire or pin resistance.
(3) Specified by design

AC Characteristics (BTL)

PVDD_x = 18 V, BTL AD mode, FS = 48 KHz, R_L = 8 Ω, R_{OCP} = 22 KΩ, C_{BST} = 33 nF, audio frequency = 1 kHz, AES17 filter, f_{PWM} = 384 kHz, T_A = 25°C (unless otherwise specified). All performance is in accordance with recommended operating conditions (unless otherwise specified).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_O	Power output per channel	PVDD = 18 V, 10% THD, 1-kHz input signal		21		W

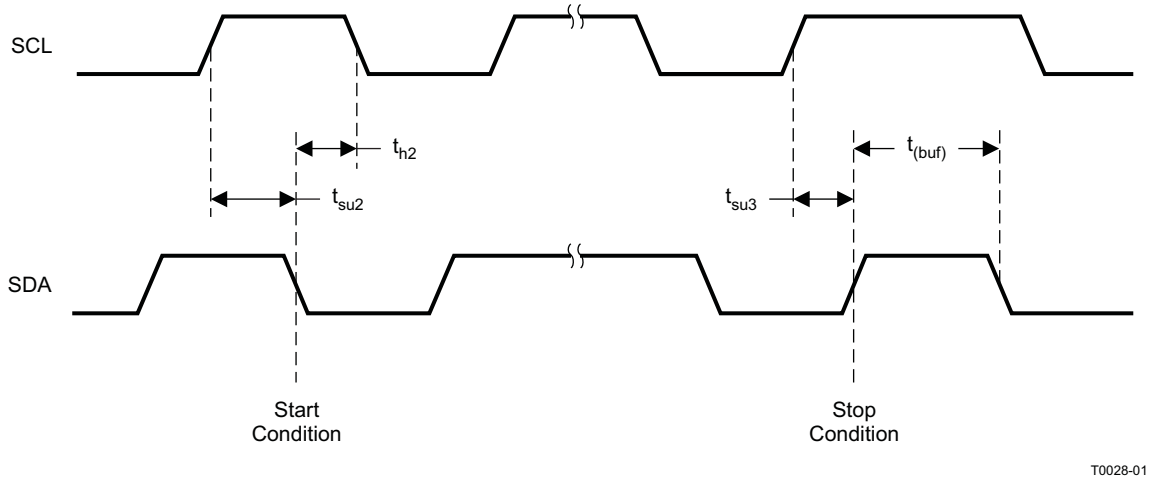

Figure 4. Start and Stop Conditions Timing

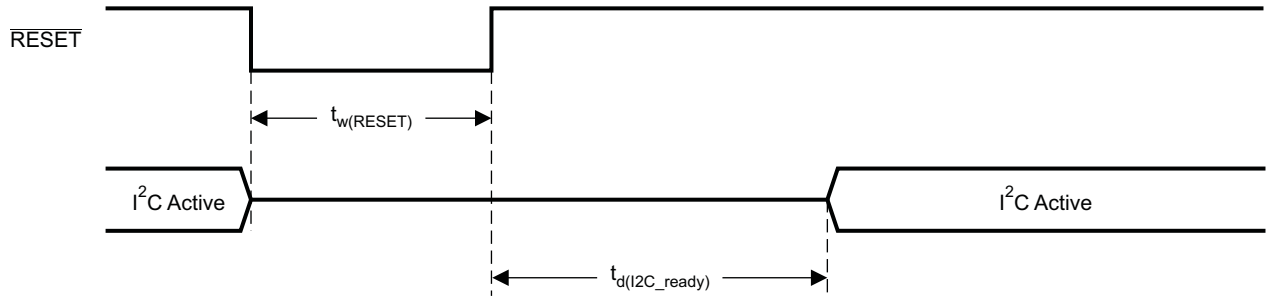
RESET TIMING ($\overline{\text{RESET}}$)

Control signal parameters over recommended operating conditions (unless otherwise noted). Please refer to Recommended Use Model section on usage of all terminals.

PARAMETER		MIN	TYP	MAX	UNIT
$t_{w(RESET)}$	Pulse duration, $\overline{\text{RESET}}$ active	100			µs
$t_{d(I2C\_ready)}$	Time to enable I^2C			12.0	ms



NOTES: On power up, it is recommended that the TAS5711 $\overline{\text{RESET}}$ be held LOW for at least 100 µs after DVDD has reached 3 V.

If the $\overline{\text{RESET}}$ is asserted LOW while $\overline{\text{PDN}}$ is LOW, then the $\overline{\text{RESET}}$ must continue to be held LOW for at least 100 µs after $\overline{\text{PDN}}$ is deasserted (HIGH).

DETAILED DESCRIPTION

POWER SUPPLY

To facilitate system design, the TAS5711 needs only a 3.3-V supply in addition to the (typical) 18-V power-stage supply. An internal voltage regulator provides suitable voltage levels for the gate drive circuitry. Additionally, all circuitry requiring a floating voltage supply, e.g., the high-side gate drive, is accommodated by built-in bootstrap circuitry requiring only a few external capacitors.

In order to provide good electrical and acoustical characteristics, the PWM signal path for the output stage is designed as identical, independent half-bridges. For this reason, each half-bridge has separate bootstrap pins (BST_x), and power-stage supply pins (PVDD_x). The gate drive voltages (GVDD_AB and GVDD_CD) are derived from the PVDD voltage. Special attention should be paid to placing all decoupling capacitors as close to their associated pins as possible. In general, inductance between the power-supply pins and decoupling capacitors must be avoided.

For a properly functioning bootstrap circuit, a small ceramic capacitor must be connected from each bootstrap pin (BST_x) to the power-stage output pin (OUT_x). When the power-stage output is low, the bootstrap capacitor is charged through an internal diode connected between the gate-drive regulator output pin (GVDD_x) and the bootstrap pin. When the power-stage output is high, the bootstrap capacitor potential is shifted above the output potential and thus provides a suitable voltage supply for the high-side gate driver. In an application with PWM switching frequencies in the range from 352 kHz to 384 kHz, it is recommended to use 33-nF 50-V X7R capacitors, size 0603 or 0805, for the bootstrap supply. These 33-nF capacitors ensure sufficient energy storage, even during minimal PWM duty cycles, to keep the high-side power stage FET (LDMOS) fully turned on during the remaining part of the PWM cycle.

Special attention should be paid to the power-stage power supply; this includes component selection, PCB placement, and routing. As indicated, each half-bridge has independent power-stage supply pins (PVDD_x). For optimal electrical performance, EMC compliance, and system reliability, it is important that each PVDD_x pin is decoupled with a 100-nF ceramic capacitor placed as close as possible to each supply pin.

The TAS5711 is fully protected against erroneous power-stage turnon due to parasitic gate charging.

ERROR REPORTING

The A_SEL pin has two functions: I^2C device-address select and fault indication. On RESET, this pin is an input and defines the I^2C address. But this pin can be programmed after RESET to be an output by writing 1 to bit 0 of I^2C register 0x05. In that mode, the A_SEL pin has the definition shown in Table 1.

Any fault resulting in device shutdown is signaled by the A_SEL pin going low (see Table 1). A latched version of this pin is available on D1 of register 0x02. The bit can be cleared only by an I^2C write.

Table 1. $\overline{\text{FAULT}}$ Output States

$\overline{\text{FAULT}}$	DESCRIPTION
0	Overcurrent (OC) or undervoltage (UVP) error or overtemperature error (OTE) or over voltage ERROR
1	No faults (normal operation)

Table 1. $\overline{\text{FAULT}}$ Output States (continued)

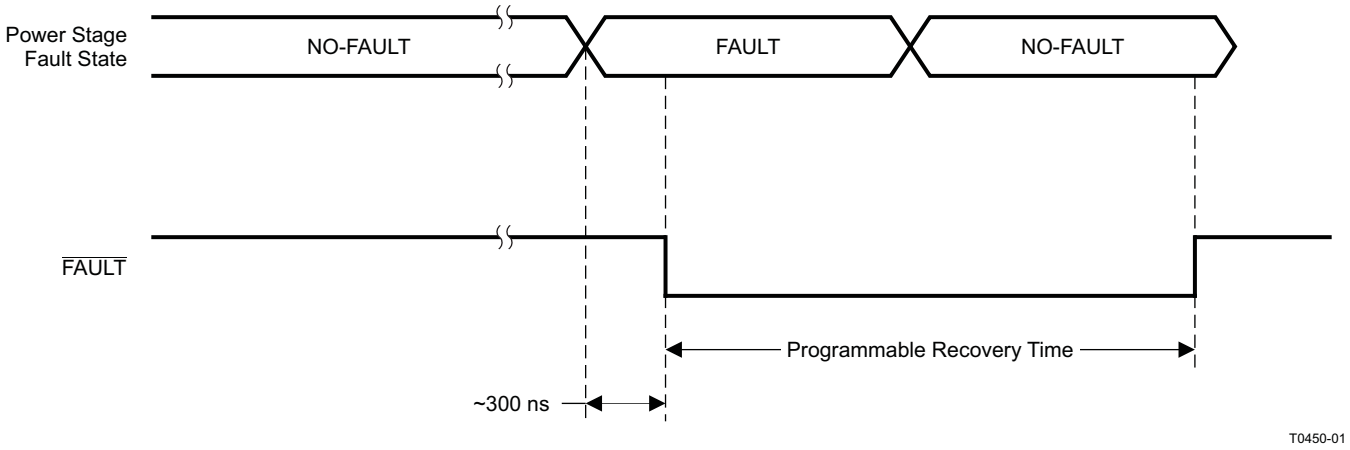

Figure 36. Fault Timing Diagram

DEVICE PROTECTION SYSTEM

Overcurrent (OC) Protection With Current Limiting

The device has independent, fast-reacting current detectors on all high-side and low-side power-stage FETs. The detector outputs are closely monitored by two protection systems. The first protection system controls the power stage in order to prevent the output current further increasing, i.e., it performs a cycle-by-cycle current-limiting function, rather than prematurely shutting down during combinations of high-level music transients and extreme speaker load impedance drops. If the high-current condition situation persists, i.e., the power stage is being overloaded, a second protection system triggers a latching shutdown, resulting in the power stage being set in the high-impedance (Hi-Z) state. The device returns to normal operation once the fault condition (i.e., a short circuit on the output) is removed. Current limiting and overcurrent protection are not independent for half-bridges. That is, if the bridge-tied load between half-bridges A and B causes an overcurrent fault, half-bridges A, B, C, and D are shut down.

Overtemperature Protection

The TAS5711 has over temperature-protection system. If the device junction temperature exceeds 150°C (nominal), the device is put into thermal shutdown, resulting in all half-bridge outputs being set in the high-impedance (Hi-Z) state and $\overline{\text{FAULT}}$ being asserted low. The TAS5711 recovers automatically once the temperature drops approximately 30°.

Undervoltage Protection (UVP) and Power-On Reset (POR)

The UVP and POR circuits of the TAS5711 fully protect the device in any power-up/down and brownout situation. While powering up, the POR circuit resets the overload circuit and ensures that all circuits are fully operational when the PVDD and AVDD supply voltages reach 7.6 V and 2.7 V, respectively. Although PVDD and AVDD are independently monitored, a supply voltage drop below the UVP threshold on AVDD or either PVDD pin results in all half-bridge outputs immediately being set in the high-impedance (Hi-Z) state and $\overline{\text{FAULT}}$ being asserted low.

SSTIMER FUNCTIONALITY

The SSTIMER pin uses a capacitor connected between this pin and ground to control the output duty cycle when exiting all-channel shutdown. The capacitor on the SSTIMER pin is slowly charged through an internal current source, and the charge time determines the rate at which the output transitions from a near zero duty cycle to the desired duty cycle. This allows for a smooth transition that minimizes audible pops and clicks. When the part is shutdown the drivers are tristated and transition slowly down through a 3K resistor, similarly minimizing pops and clicks. The shutdown transition time is independent of SSTIMER pin capacitance. Larger capacitors will increase the start-up time, while capacitors smaller than 2.2 nF will decrease the start-up time. The SSTIMER pin should be left floating for BD modulation (BTL and PBTL modes) and in 2.1 mode.

CLOCK, AUTO DETECTION, AND PLL

The TAS5711 is a slave device. It accepts MCLK, SCLK, and LRCLK. The digital audio processor (DAP) supports all the sample rates and MCLK rates that are defined in the clock control register .

The TAS5711 checks to verify that SCLK is a specific value of 32 f_S, 48 f_S, or 64 f_S. The DAP only supports a 1 × f_S LRCLK. The timing relationship of these clocks to SDIN is shown in subsequent sections. The clock section uses MCLK or the internal oscillator clock (when MCLK is unstable, out of range, or absent) to produce the internal clock (DCLK) running at 512 time the PWM switching frequency.

The DAP can autodetect and set the internal clock control logic to the appropriate settings for all supported clock rates as defined in the clock control register.

TAS5711 has robust clock error handling that uses the bulit-in trimmed oscillator clock to quickly detect changes/errors. Once the system detects a clock change/error, it will mute the audio (through a single step mute) and then force PLL to limp using the internal oscillator as a reference clock. Once the clocks are stable, the system will auto detect the new rate and revert to normal operation. During this process, the default volume will be restored in a single step (also called hard unmute). The ramp process can be programmed to ramp back slowly (also called soft unmute) as defined in volume register (0x0E).

SERIAL DATA INTERFACE

Serial data is input on SDIN. The PWM outputs are derived from SDIN. The TAS5711 DAP accepts serial data in 16-, 20-, or 24-bit left-justified, right-justified, and I^2S serial data formats.

PWM Section

The TAS5711 DAP device uses noise-shaping and sophisticated non-linear correction algorithms to achieve high power efficiency and high-performance digital audio reproduction. The DAP uses a fourth-order noise shaper to increase dynamic range and SNR in the audio band. The PWM section accepts 24-bit PCM data from the DAP and outputs two BTL PWM audio output channels.

The PWM section has individual channel dc blocking filters that can be enabled and disabled. The filter cutoff frequency is less than 1 Hz. Individual channel de-emphasis filters for 44.1- and 48-kHz are included and can be enabled and disabled.

Finally, the PWM section has an adjustable maximum modulation limit of 93.8% to 99.2%.

For detailed description of using audio processing features like DRC, EQ, 3D, and Bass Boost, please refer to User's Guide and TAS570X GDE software development tool documentation. Also refer to GDE software development tool for device data path.

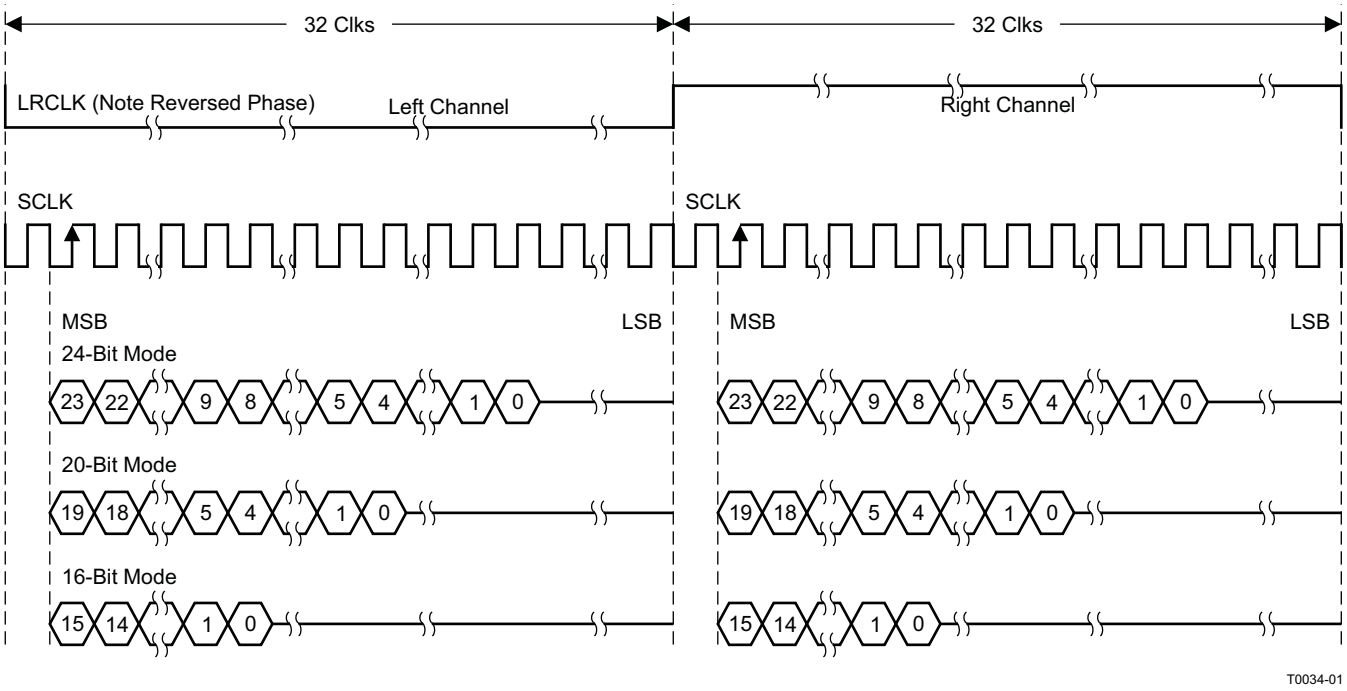
SERIAL INTERFACE CONTROL AND TIMING

The I^2S mode is set by writing to register 0x04.

I^2S Timing

I^2S timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is low for the left channel and high for the right channel. A bit clock running at 32, 48, or 64 × f_S is used to clock in the data. There is a delay of one bit clock from the time the LRCLK signal changes state to the first bit of data on the data lines. The data is written MSB first and is valid on the rising edge of bit clock. The DAP masks unused trailing data bit positions.

2-Channel I²S (Philips Format) Stereo Input



NOTE: All data presented in 2s-complement form with MSB first.

Figure 37. I²S 64-f_S Format

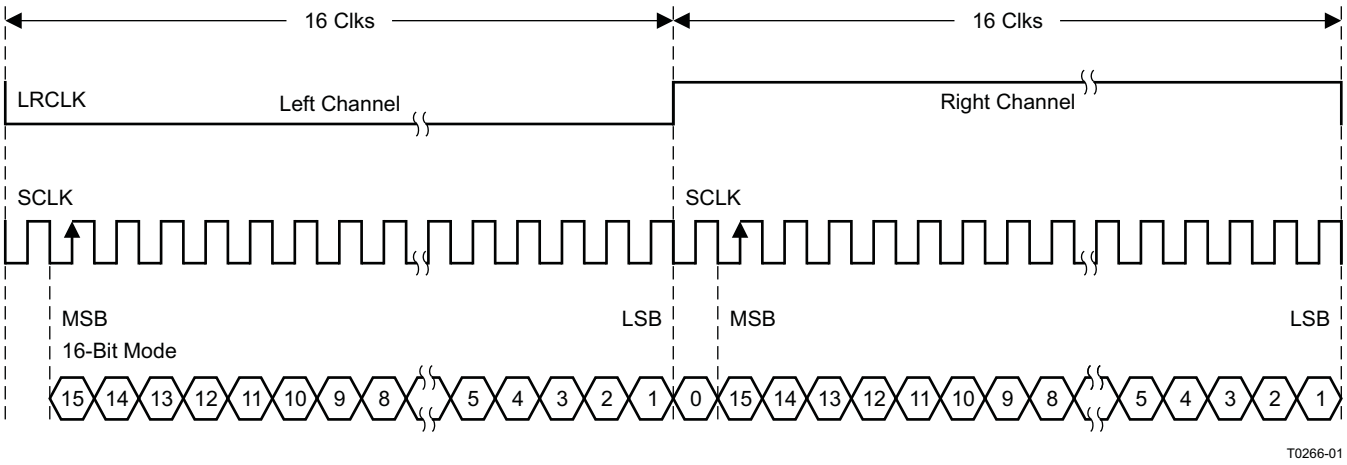
NOTE: All data presented in 2s-complement form with MSB first.

Figure 38. I²S 48-f_S Format

2-Channel I²S (Philips Format) Stereo Input



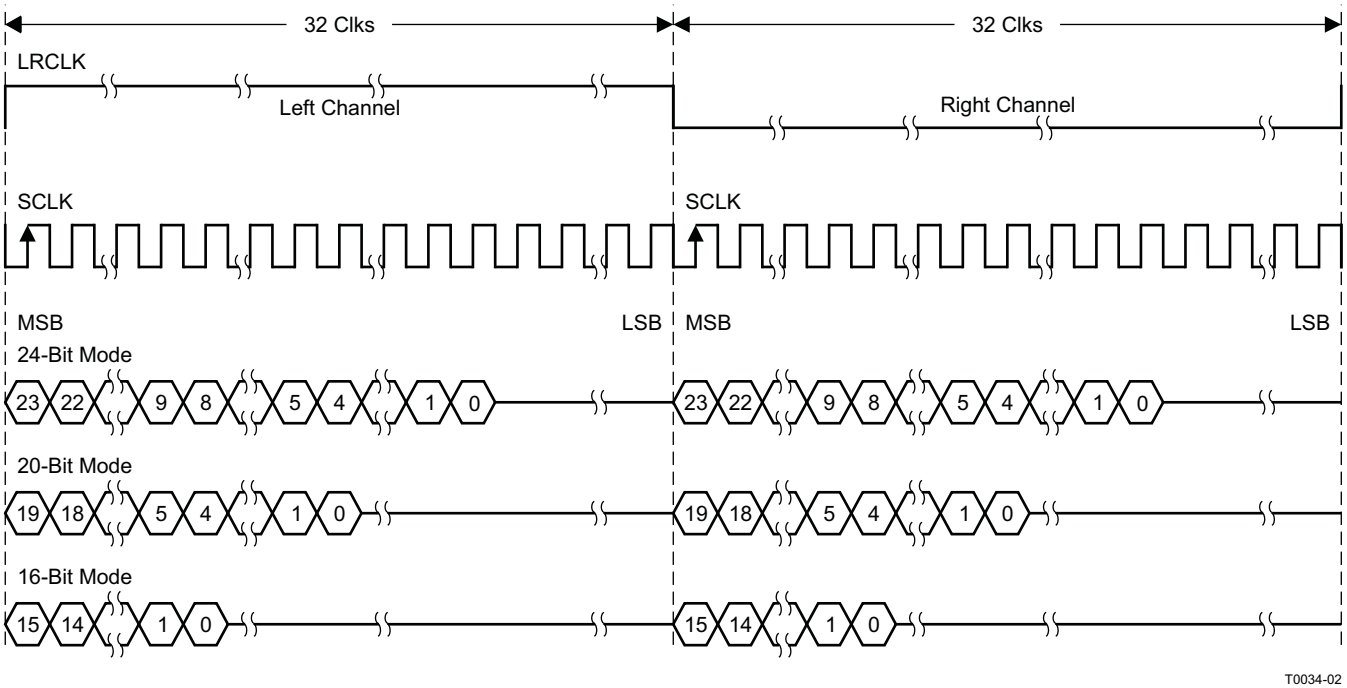
NOTE: All data presented in 2s-complement form with MSB first.

Figure 39. I²S 32-f_S Format

Left-Justified

Left-justified (LJ) timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is high for the left channel and low for the right channel. A bit clock running at 32, 48, or 64 × f_S is used to clock in the data. The first bit of data appears on the data lines at the same time LRCLK toggles. The data is written MSB first and is valid on the rising edge of the bit clock. The DAP masks unused trailing data bit positions.

2-Channel Left-Justified Stereo Input



NOTE: All data presented in 2s-complement form with MSB first.

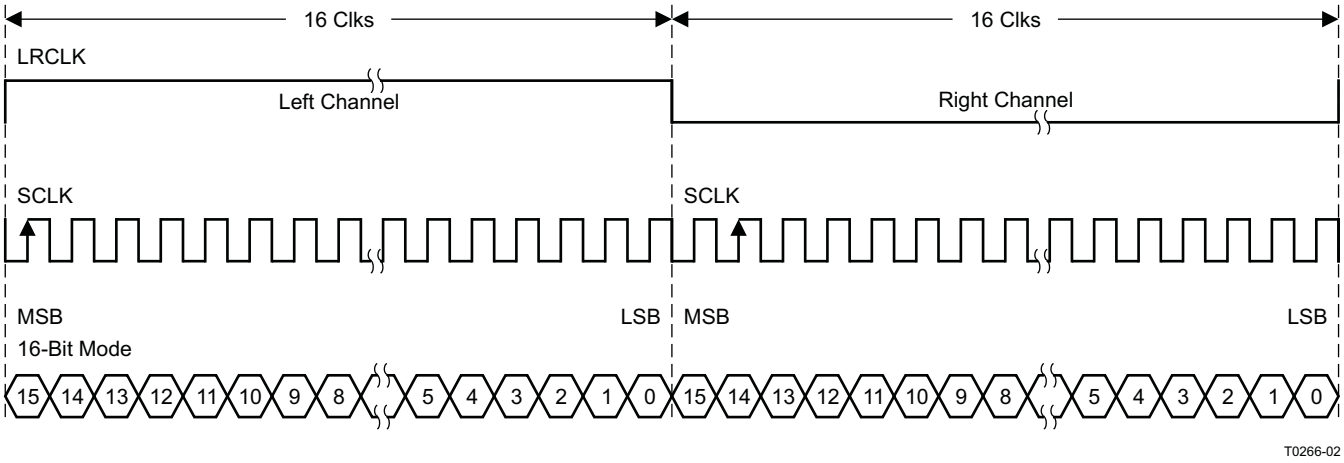
2-Channel Left-Justified Stereo Input



NOTE: All data presented in 2s-complement form with MSB first.

Figure 42. Left-Justified 32-f_S Format

Right-Justified

Right-justified (RJ) timing uses LRCLK to define when the data being transmitted is for the left channel and when

it is for the right channel. LRCLK is high for the left channel and low for the right channel. A bit clock running at 32, 48, or 64 × f_S is used to clock in the data. The first bit of data appears on the data 8 bit-clock periods (for 24-bit data) after LRCLK toggles. In RJ mode the LSB of data is always clocked by the last bit clock before LRCLK transitions. The data is written MSB first and is valid on the rising edge of bit clock. The DAP masks unused leading data bit positions.

I²C SERIAL CONTROL INTERFACE

The TAS5711 DAP has a bidirectional I²C interface that compatible with the I²C (Inter IC) bus protocol and supports both 100-kHz and 400-kHz data transfer rates for single and multiple byte write and read operations. This is a slave only device that does not support a multimaster bus environment or wait state insertion. The control interface is used to program the registers of the device and to read device status.

The DAP supports the standard-mode I²C bus operation (100 kHz maximum) and the fast I²C bus operation (400 kHz maximum). The DAP performs all I²C operations without I²C wait cycles.

General I²C Operation

The I²C bus employs two signals; SDA (data) and SCL (clock), to communicate between integrated circuits in a system. Data is transferred on the bus serially one bit at a time. The address and data can be transferred in byte (8-bit) format, with the most significant bit (MSB) transferred first. In addition, each byte transferred on the bus is acknowledged by the receiving device with an acknowledge bit. Each transfer operation begins with the master device driving a start condition on the bus and ends with the master device driving a stop condition on the bus. The bus uses transitions on the data pin (SDA) while the clock is high to indicate a start and stop conditions. A high-to-low transition on SDA indicates a start and a low-to-high transition indicates a stop. Normal data bit transitions must occur within the low time of the clock period. These conditions are shown in Figure 46. The master generates the 7-bit slave address and the read/write (R/$\overline{W}$) bit to open communication with another device and then waits for an acknowledge condition. The TAS5711 holds SDA low during the acknowledge clock period to indicate an acknowledgment. When this occurs, the master transmits the next byte of the sequence. Each device is addressed by a unique 7-bit slave address plus R/$\overline{W}$ bit (1 byte). All compatible devices share the same signals via a bidirectional bus using a wired-AND connection. An external pullup resistor must be used for the SDA and SCL signals to set the high level for the bus.

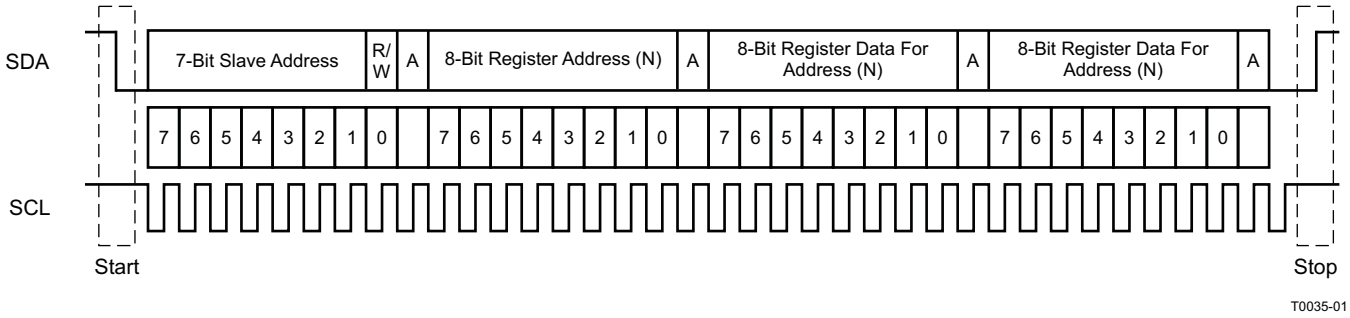

Figure 46. Typical I²C Sequence

There is no limit on the number of bytes that can be transmitted between start and stop conditions. When the last word transfers, the master generates a stop condition to release the bus. A generic data transfer sequence is shown in Figure 46.

Pin $\overline{A\_SEL}$ defines the I²C device address. An external 15-kΩ pulldown on this pin gives a device address of 0x34 and a 15-kΩ pullup gives a device address of 0x36. The 7-bit address is 0011011 (0x36) or 0011010 (0x34).

I²C Device Address Change Procedure

- Write to device address change enable register, 0xF8 with a value of 0xF9 A5 A5 A5.
- Write to device register 0xF9 with a value of 0x0000 00XX, where XX is the new address.
- Any writes after that should use the new device address XX.

Single- and Multiple-Byte Transfers

The serial control interface supports both single-byte and multiple-byte read/write operations for subaddresses 0x00 to 0x1F. However, for the subaddresses 0x20 to 0xFF, the serial control interface supports only multiple-byte read/write operations (in multiples of 4 bytes).

During multiple-byte read operations, the DAP responds with data, a byte at a time, starting at the subaddress assigned, as long as the master device continues to respond with acknowledges. If a particular subaddress does not contain 32 bits, the unused bits are read as logic 0.

During multiple-byte write operations, the DAP compares the number of bytes transmitted to the number of bytes that are required for each specific subaddress. For example, if a write command is received for a biquad subaddress, the DAP expects to receive five 32-bit words. If fewer than five 32-bit data words have been received when a stop command (or another start command) is received, the data received is discarded.

Supplying a subaddress for each subaddress transaction is referred to as random I^2C addressing. The TAS5711 also supports sequential I^2C addressing. For write transactions, if a subaddress is issued followed by data for that subaddress and the 15 subaddresses that follow, a sequential I^2C write transaction has taken place, and the data for all 16 subaddresses is successfully received by the TAS5711. For I^2C sequential write transactions, the subaddress then serves as the start address, and the amount of data subsequently transmitted, before a stop or start is transmitted, determines how many subaddresses are written. As was true for random addressing, sequential addressing requires that a complete set of data be transmitted. If only a partial set of data is written to the last subaddress, the data for the last subaddress is discarded. However, all other data written is accepted; only the incomplete data is discarded.

Single-Byte Write

As shown in Figure 47, a single-byte data write transfer begins with the master device transmitting a start condition followed by the I^2C device address and the read/write bit. The read/write bit determines the direction of the data transfer. For a write data transfer, the read/write bit will be a 0. After receiving the correct I^2C device address and the read/write bit, the DAP responds with an acknowledge bit. Next, the master transmits the address byte or bytes corresponding to the TAS5711 internal memory address being accessed. After receiving the address byte, the TAS5711 again responds with an acknowledge bit. Next, the master device transmits the data byte to be written to the memory address being accessed. After receiving the data byte, the TAS5711 again responds with an acknowledge bit. Finally, the master device transmits a stop condition to complete the single-byte data write transfer.

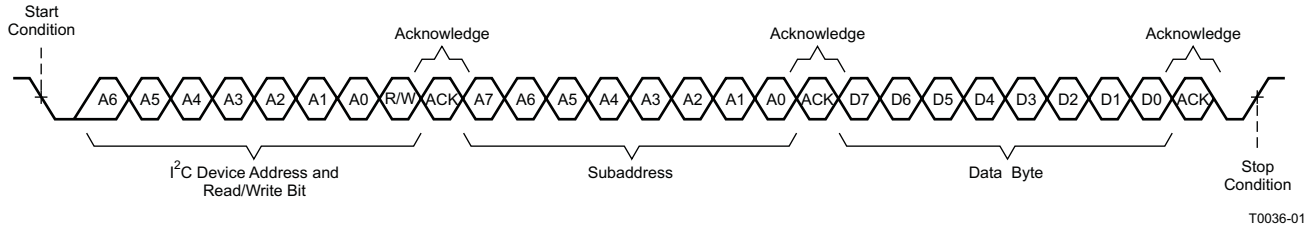

Figure 47. Single-Byte Write Transfer

Multiple-Byte Write

A multiple-byte data write transfer is identical to a single-byte data write transfer except that multiple data bytes are transmitted by the master device to the DAP as shown in Figure 48. After receiving each data byte, the TAS5711 responds with an acknowledge bit.

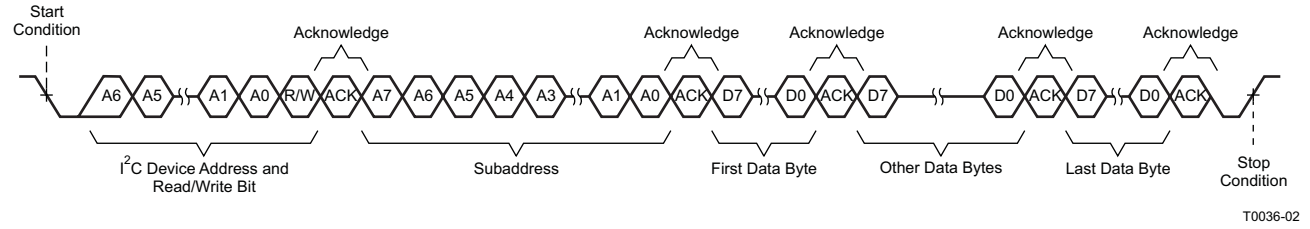

Figure 48. Multiple-Byte Write Transfer

Single-Byte Read

As shown in Figure 49, a single-byte data read transfer begins with the master device transmitting a start condition followed by the I²C device address and the read/write bit. For the data read transfer, both a write followed by a read are actually done. Initially, a write is done to transfer the address byte or bytes of the internal memory address to be read. As a result, the read/write bit becomes a 0. After receiving the TAS5711 address and the read/write bit, TAS5711 responds with an acknowledge bit. In addition, after sending the internal memory address byte or bytes, the master device transmits another start condition followed by the TAS5711 address and the read/write bit again. This time the read/write bit becomes a 1, indicating a read transfer. After receiving the address and the read/write bit, the TAS5711 again responds with an acknowledge bit. Next, the TAS5711 transmits the data byte from the memory address being read. After receiving the data byte, the master device transmits a not acknowledge followed by a stop condition to complete the single byte data read transfer.

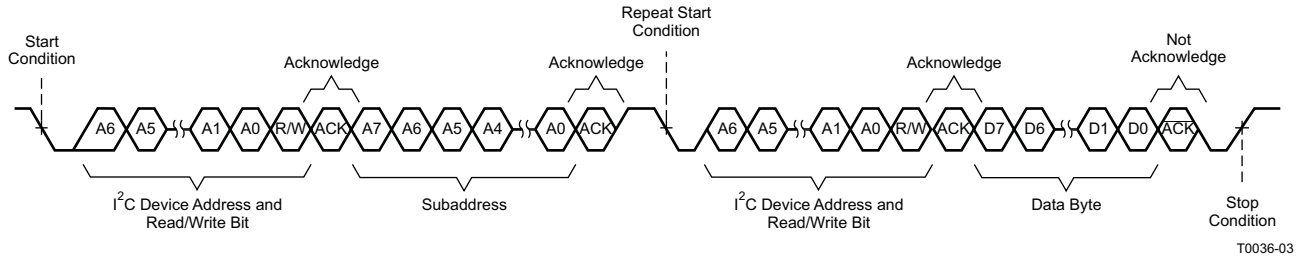

Figure 49. Single-Byte Read Transfer

Multiple-Byte Read

A multiple-byte data read transfer is identical to a single-byte data read transfer except that multiple data bytes are transmitted by the TAS5711 to the master device as shown in Figure 50. Except for the last data byte, the master device responds with an acknowledge bit after receiving each data byte.

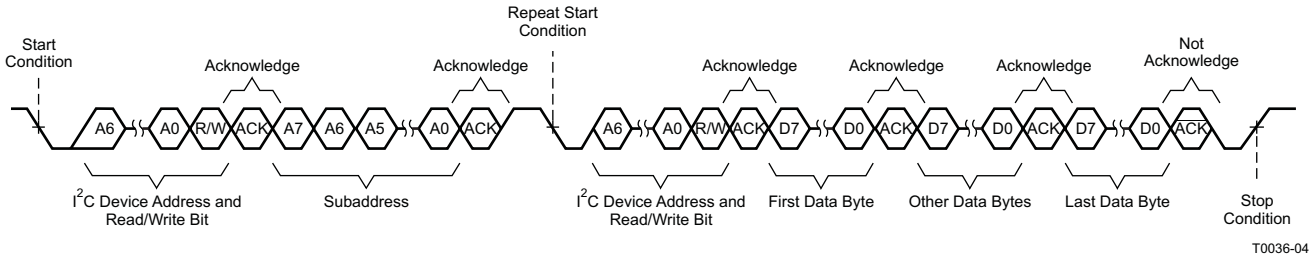

Figure 50. Multiple Byte Read Transfer

Output Mode and MUX Selection

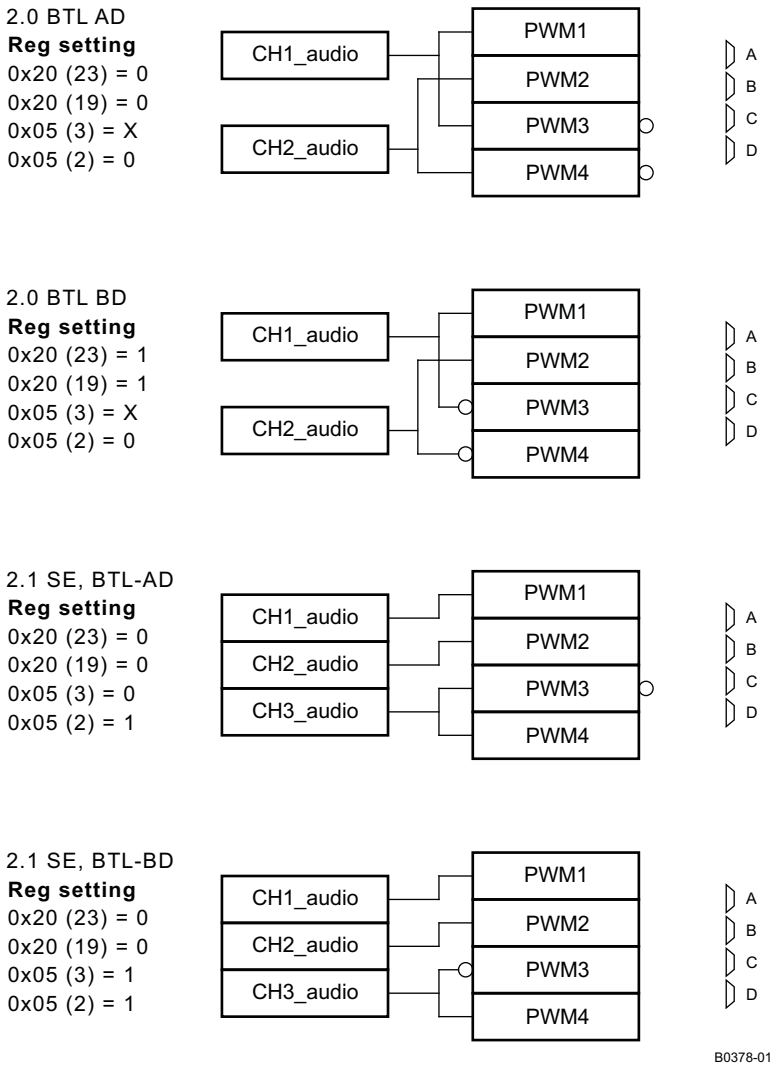

Figure 51. Output Mode and MUX Selection

2.1-Mode Support

The TAS5711 uses a special *mid-Z ramp* sequence to reduce click and pop in SE-mode and 2.1-mode operation.To enable the mid-Z ramp, register 0x05 bit D7 must be set to 1. To enable 2.1 mode, register 0x05 bit D2 must be set to 1. The SSTIMER pin should be left floating in this mode.

Single-Filter PBTL-Mode Support

The TAS5711 supports parallel BTL (PBTL) mode with OUT_A/OUT_B (and OUT_C/OUT_D) connected before the LC filter. In order to put the part in PBTL configuration, drive PBTL (pin 8) HIGH. This synchronizes the turnoff of half-bridges A and B (and similarly C/D) if an overcurrent condition is detected in either half-bridge. There is a pulldown resistor on the PBTL pin that configures the part in BTL mode if the pin is left floating.

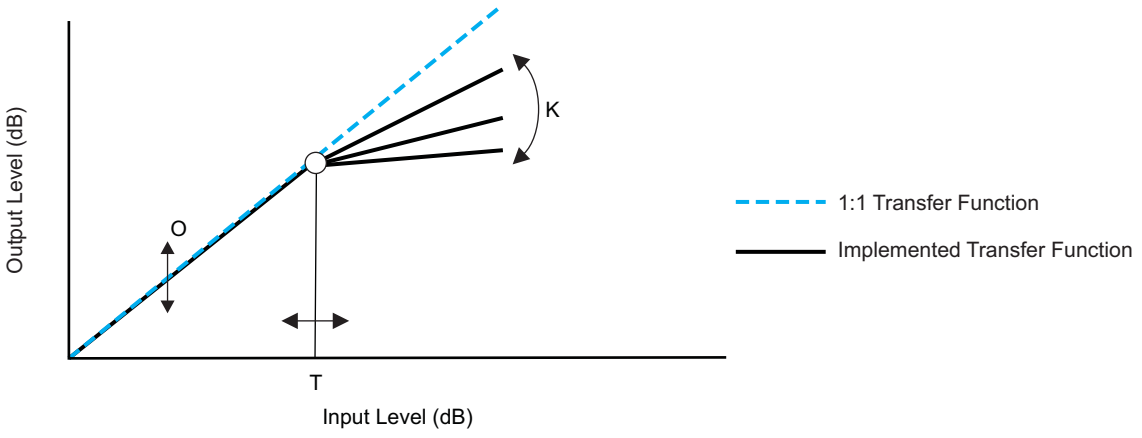
PWM output multiplexers should be updated to set the device in PBTL mode. Output Mux Register (0x25) should be written with a value of 0x01 10 32 45. Also, the PWM shutdown register (0x19) should be written with a value of 0x3A.

Dynamic Range Control (DRC)

The DRC scheme has a single threshold, offset, and slope (all programmable). There is one ganged DRC for the left/right channels and one DRC for the subchannel.

The DRC input/output diagram is shown in Figure 52.

Refer to GDE software tool for more description on T, K, and O parameters.

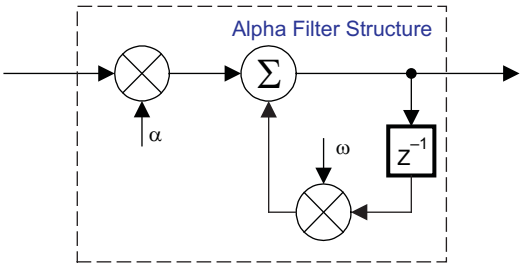


Professional-quality dynamic range compression automatically adjusts volume to flatten volume level.

- Each DRC has adjustable threshold, offset, and compression levels
- Programmable energy, attack, and decay time constants
- *Transparent compression*: compressors can attack fast enough to avoid apparent clipping before engaging, and decay times can be set slow enough to avoid pumping.

Figure 52. Dynamic Range Control

	α, ω	T, K, O	α_a, ω_a / α_d, ω_d
DRC1	0x3A	0x40, 0x41, 0x42	0x3B / 0x3C
DRC2	0x3D	0x43, 0x44, 0x45	0x3E / 0x3F



NOTE:
$\omega = 1 - \alpha$

T = 9.23 format, all other DRC coefficients are 3.23 format

Figure 53. DRC Structure

BANK SWITCHING

The TAS5711 uses an approach called *bank switching* together with automatic sample-rate detection. All processing features that must be changed for different sample rates are stored internally in three banks. The user can program which sample rates map to each bank. By default, bank 1 is used in 32kHz mode, bank 2 is used in 44.1/48 kHz mode, and bank 3 is used for all other rates. Combined with the clock-rate autodetection feature, bank switching allows the TAS5711 to detect automatically a change in the input sample rate and switch to the appropriate bank without any MCU intervention.

An external controller configures bankable locations (0x29-0x36, 0x3A-0x3F, and 0x58-0x5F) for all three banks during the initialization sequence.

If auto bank switching is enabled (register 0x50, bits 2:0) , then the TAS5711 automatically swaps the coefficients for subsequent sample rate changes, avoiding the need for any external controller intervention for a sample rate change.

By default, bits 2:0 have the value 000; indicating that bank switching is disabled. In that state, updates to bankable locations take immediate effect. A write to register 0x50 with bits 2:0 being 001, 010, or 011 brings the system into the coefficient-bank-update state *update bank1*, *update bank2,* or *update bank3*, respectively. Any subsequent write to bankable locations updates the coefficient banks stored outside the DAP. After updating all the three banks, the system controller should issue a write to register 0x50 with bits 2:0 being 100; this changes the system state to automatic bank switching mode. In automatic bank switching mode, the TAS5711 automatically swaps banks based on the sample rate.

Command sequences for updating DAP coefficients can be summarized as follows:

1. **Bank switching disabled (default):** DAP coefficient writes take immediate effect and are not influenced by subsequent sample rate changes.

   OR

   Bank switching enabled:

   (a) Update bank-1 mode: Write "001" to bits 2:0 of reg 0x50. Load the 32 kHz coefficients.
   (b) Update bank-2 mode: Write "010" to bits 2:0 of reg 0x50. Load the 48 kHz coefficients.
   (c) Update bank-3 mode: Write "011" to bits 2:0 of reg 0x50. Load the other coefficients.
   (d) Enable automatic bank switching by writing "100" to bits 2:0 of reg 0x50.

26-Bit 3.23 Number Format

All mixer gain coefficients are 26-bit coefficients using a 3.23 number format. Numbers formatted as 3.23 numbers means that there are 3 bits to the left of the decimal point and 23 bits to the right of the decimal point. This is shown in Figure 54 .

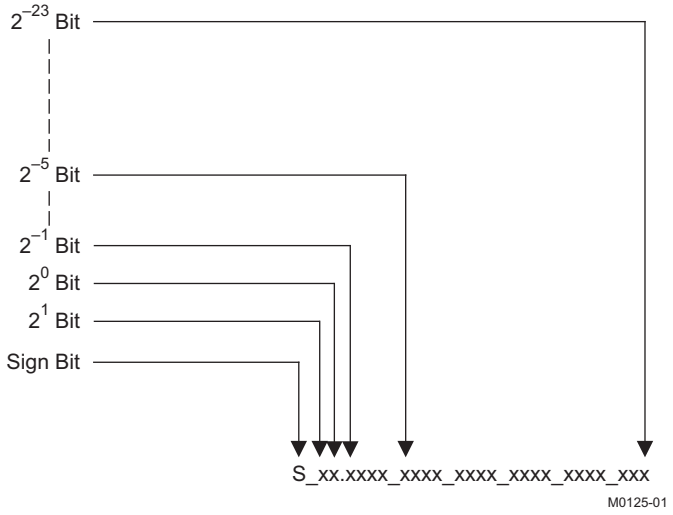


Figure 54. 3.23 Format

The decimal value of a 3.23 format number can be found by following the weighting shown in Figure 54. If the most significant bit is logic 0, the number is a positive number, and the weighting shown yields the correct number. If the most significant bit is a logic 1, then the number is a negative number. In this case every bit must be inverted, a 1 added to the result, and then the weighting shown in Figure 55 applied to obtain the magnitude of the negative number.

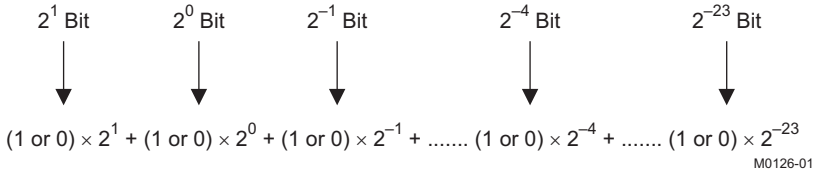

Figure 55. Conversion Weighting Factors—3.23 Format to Floating Point

Gain coefficients, entered via the I^2C bus, must be entered as 32-bit binary numbers. The format of the 32-bit number (4-byte or 8-digit hexadecimal number) is shown in Figure 56

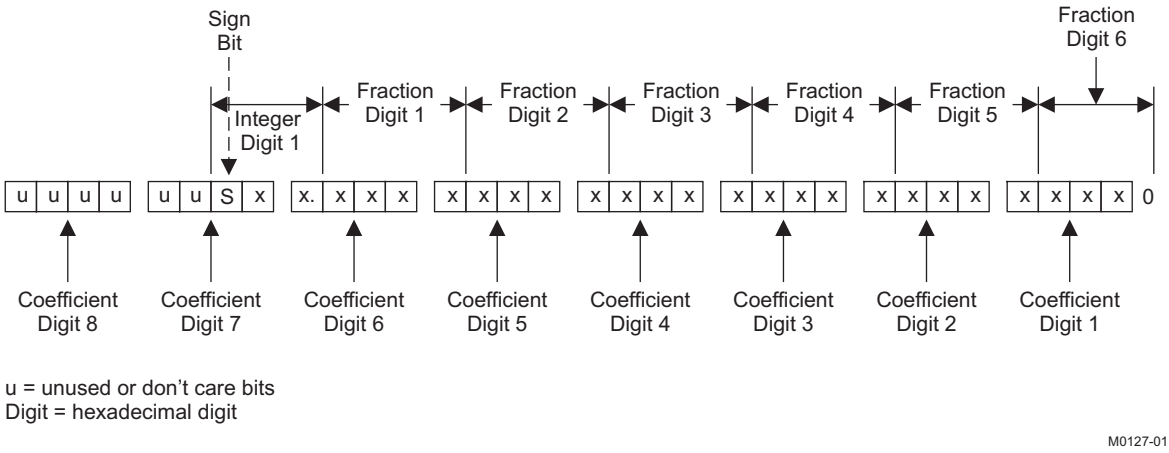

Figure 56. Alignment of 3.23 Coefficient in 32-Bit I2C Word

Recommended Use Model

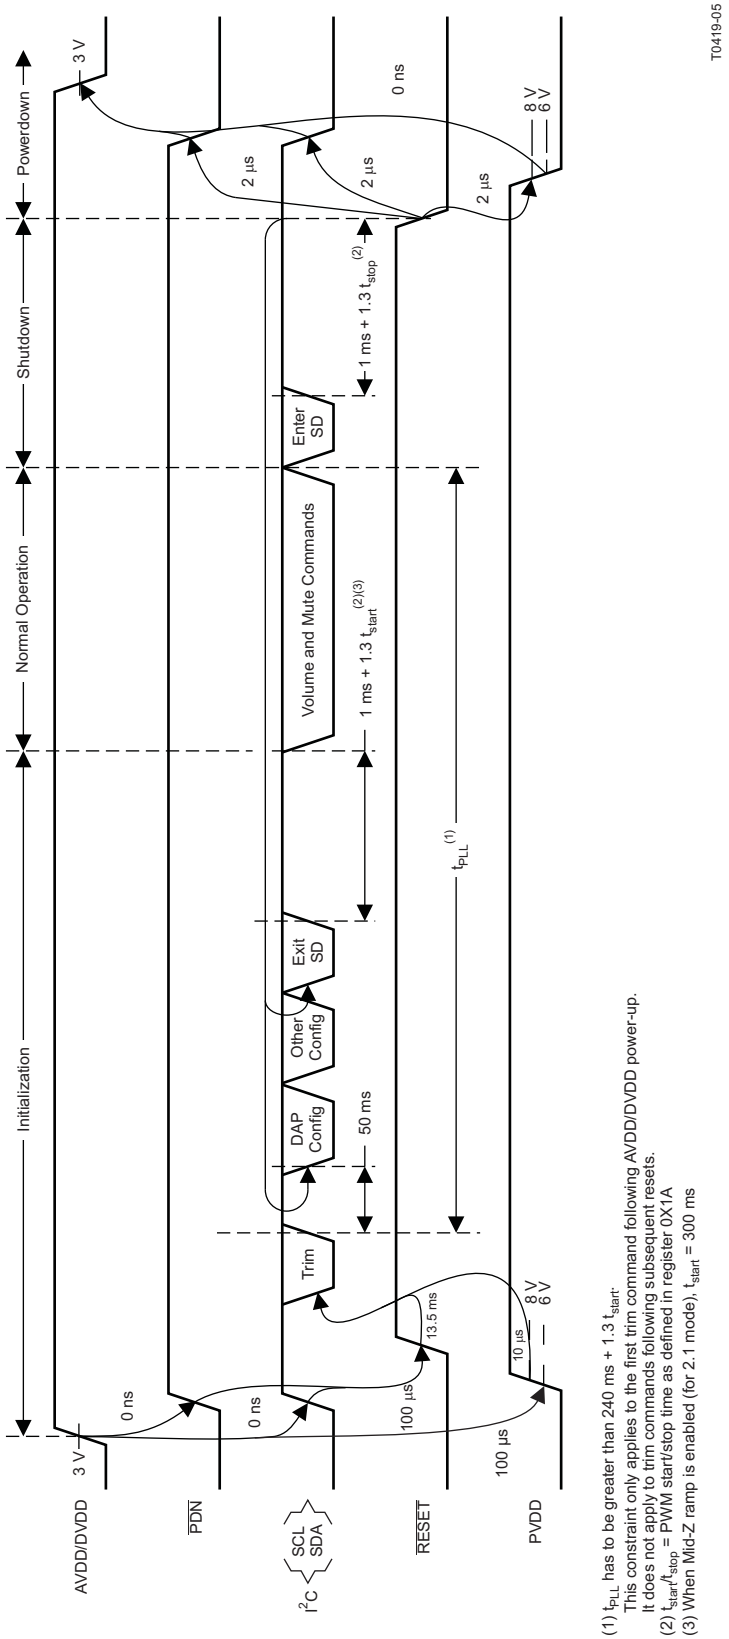

Figure 57. Recommended Command Sequence

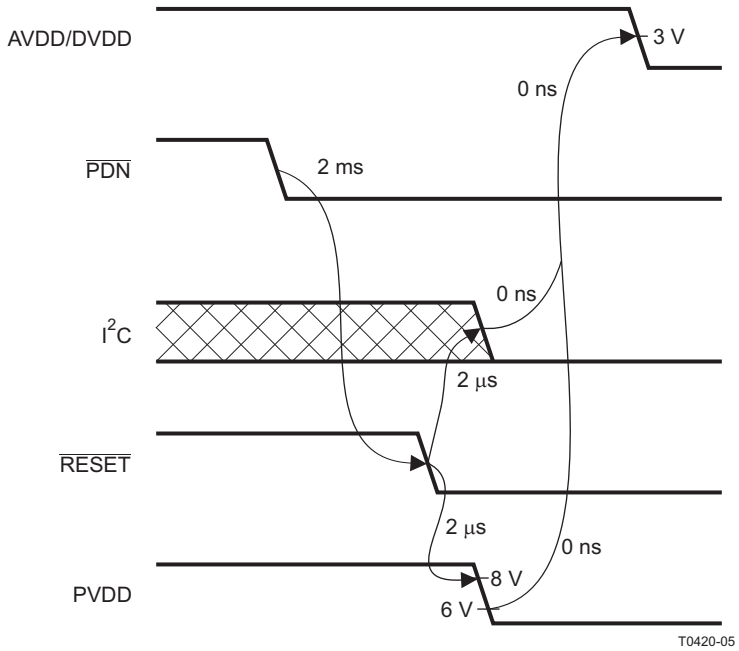

Figure 58. Power Loss Sequence

Recommended Command Sequences

Initialization Sequence

Use the following sequence to power-up and initialize the device:

1. Hold all digital inputs low and ramp up AVDD/DVDD to at least 3 V.
2. Initialize digital inputs and PVDD supply as follows:
   - Drive $\overline{\text{RESET}}$ = 0, $\overline{\text{PDN}}$ = 1, and other digital inputs to their desired state while ensuring that all are never more than 2.5 V above AVDD/DVDD. Wait at least 100 µs, drive $\overline{\text{RESET}}$ = 1, and wait at least another 13.5 ms.
   - Ramp up PVDD to at least 8 V while ensuring that it remains below 6 V for at least 100 µs after AVDD/DVDD reaches 3 V. Then wait at least another 10 µs.
3. Trim oscillator (write 0x00 to register 0x1B) and wait at least 50 ms.
4. Configure the DAP via I^2C (see Users's Guide for typical values).
5. Configure remaining registers.
6. Exit shutdown (sequence defined below).

Normal Operation

The following are the only events supported during normal operation:

1. Writes to master/channel volume registers.
2. Writes to soft mute register.
3. Enter and exit shutdown (sequence defined below).

Note: Event 3 is not supported for 240 ms + 1.3 × t_{start} after trim following AVDD/DVDD powerup ramp (where t_{start} is 300 ms when mid-Z ramp is enabled and is otherwise specified by register 0x1A).

Shutdown Sequence

Enter:

1. Write 0x40 to register 0x05.
2. Wait at least 1 ms + 1.3 × t_{stop} (where t_{stop} is specified by register 0x1A).
3. If desired, reconfigure by returning to step 4 of initialization sequence.

Exit:

1. Write 0x00 to register 0x05 (exit shutdown command may not be serviced for as much as 240 ms after trim following AVDD/DVDD powerup ramp).
2. Wait at least 1 ms + 1.3 × t_{start} (where t_{start} is 300 ms when mid-Z ramp is enabled and is otherwise specified by register 0x1A).
3. Proceed with normal operation.

Power-Down Sequence

Use the following sequence to powerdown the device and its supplies:

1. If time permits, enter shutdown (sequence defined above); else, in case of sudden power loss, assert $\overline{\text{PDN}}$ = 0 and wait at least 2 ms.
2. Assert $\overline{\text{RESET}}$ = 0.
3. Drive digital inputs low and ramp down PVDD supply as follows:
   - Drive all digital inputs low after $\overline{\text{RESET}}$ has been low for at least 2 µs.
   - Ramp down PVDD while ensuring that it remains above 8 V until $\overline{\text{RESET}}$ has been low for at least 2 µs.
4. Ramp down AVDD/DVDD while ensuring that it remains above 3 V until PVDD is below 6 V and that it is never more than 2.5 V below the digital inputs.

All DAP coefficients are 3.23 format unless specified otherwise.

CLOCK CONTROL REGISTER (0x00)

The clocks and data rates are automatically determined by the TAS5711. The clock control register contains the auto-detected clock status. Bits D7–D5 reflect the sample rate. Bits D4–D2 reflect the MCLK frequency. The device accepts a 64 f_S or 32 f_S SCLK rate for all MCLK ratios, but accepts a 48 f_S SCLK rate for MCLK ratios of 192 f_S and 384 f_S only.

Table 5. Clock Control Register (0x00)

(1) Reserved registers should not be accessed.
(2) Default values are in **bold**.
(3) Only available for 44.1 kHz and 48 kHz rates.
(4) Rate only available for 32/44.1/48 KHz sample rates
(5) Not available at 8 kHz

DEVICE ID REGISTER (0x01)

The device ID register contains the ID code for the firmware revision.

Table 6. General Status Register (0x01)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION
0	**0**	**0**	**0**	**0**	**0**	**0**	**0**	**Identification code**

ERROR STATUS REGISTER (0x02)

The error bits are sticky and are not cleared by the hardware. This means that the software must clear the register (write zeroes) and then read them to determine if they are persistent errors.

Error Definitions:

- MCLK Error : MCLK frequency is changing. The number of MCLKs per LRCLK is changing.
- SCLK Error: The number of SCLKs per LRCLK is changing.
- LRCLK Error: LRCLK frequency is changing.
- Frame Slip: LRCLK phase is drifting with respect to internal Frame Sync.

Table 7. Error Status Register (0x02)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION
1	-	–	–	–	–	–	–	MCLK error

0	**0**	**0**	**0**	**0**	**0**	**0**	–	**No errors** (1)

(1) Default values are in **bold**.

SYSTEM CONTROL REGISTER 1 (0x03)

The system control register 1 has several functions:

Bit D7: If 0, the dc-blocking filter for each channel is disabled.
If 1, the dc-blocking filter (–3 dB cutoff <1 Hz) for each channel is enabled (default).

Bit D5: If 0, use soft unmute on recovery from clock error. This is a slow recovery. Unmute takes the same time as the volume ramp defined in register 0x0E.
If 1, use hard unmute on recovery from clock error (default). This is a fast recovery, a single step volume ramp

Bits D1–D0: Select de-emphasis

Table 8. System Control Register 1 (0x03)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION
0	–	–	–	–	–	–	–	PWM high-pass (dc blocking) disabled

–	–	–	–	–	–	1	0	De-emphasis for f_S = 44.1 kHz
–	–	–	–	–	–	1	1	De-emphasis for f_S = 48 kHz

(1) Default values are in **bold**.

SERIAL DATA INTERFACE REGISTER (0x04)

As shown in Table 9, the TAS5711 supports 9 serial data modes. The default is 24-bit, I^2S mode,

Table 9. Serial Data Interface Control Register (0x04) Format

RECEIVE SERIAL DATA INTERFACE FORMAT	WORD LENGTH	D7–D4	D3	D2	D1	D0

SYSTEM CONTROL REGISTER 2 (0x05)

When bit D6 is set low, the system exits all channel shutdown and starts playing audio; otherwise, the outputs are shut down(hard mute).

Table 10. System Control Register 2 (0x05)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION
0	–	–	–	–	–	–	–	**Mid-Z ramp disabled** (1)

(1) Default values are in **bold**.

VOLUME CONFIGURATION REGISTER (0x0E)

Bits D2–D0: Volume slew rate (Used to control volume change and MUTE ramp rates). These bits control the number of steps in a volume ramp.Volume steps occur at a rate that depends on the sample rate of the I2S data as follows

Sample Rate (KHz)	Approximate Ramp Rate
8/16/32	125 us/step
11.025/22.05/44.1	90.7 us/step
12/24/48	83.3 us/step

(1) Default values are in **bold**.

ICD settings have high impact on audio performance (e.g., dynamic range, THD, crosstalk etc.). Therefore, appropriate ICD settings must be used. By default, the device has ICD settings for AD mode. If used in BD mode, then update these registers before coming out of all-channel shutdown.

REGISTER	AD MODE	BD MODE
0x11	AC	B8
0x12	54	60
0x13	AC	A0
0x14	54	48

PWM SHUTDOWN GROUP REGISTER (0x19)

Settings of this register determine which PWM channels are active. The value should be 0x30 for BTL mode and 0x3A for PBTL mode. The default value of this register is 0x30. The functionality of this register is tied to the state of bit D5 in the system control register.

This register defines which channels belong to the shutdown group (SDG). If a 1 is set in the shutdown group register, that particular channel is **not** started following an exit *out of all-channel shutdown* command (if bit D5 is set to 0 in system control register 2, 0x05).

Table 16. Shutdown Group Register

–	–	–	–	–	–	–	**0**	**PWM channel 1 does not belong to shutdown group.** (1)
–	–	–	–	–	–	–	1	PWM channel 1 belongs to shutdown group.

(1) Default values are in **bold**.

START/STOP PERIOD REGISTER (0x1A)

This register is used to control the soft-start and soft-stop period following an enter/exit all channel shut down command or change in the $\overline{PDN}$ state. This helps reduce pops and clicks at start-up and shutdown.The times are only approximate and vary depending on device activity level and I2S clock stability.

Table 17. Start/Stop Period Register (0x1A)

(1) Default values are in **bold**.

OSCILLATOR TRIM REGISTER (0x1B)

The TAS5711 PWM processor contains an internal oscillator to support autodetect of I2S clock rates. This reduces system cost because an external reference is not required. Currently, TI recommends a reference resistor value of 18.2 kΩ (1%). This should be connected between OSC_RES and DVSSO.

Writing 0x00 to register 0x1B enables the trim that was programmed at the factory.

Note that trim must always be run following reset of the device.

Table 18. Oscillator Trim Register (0x1B)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION

–	–	–	–	–	–	–	**0**	**Reserved** (1)

(1) Default values are in **bold**.

BKND_ERR REGISTER (0x1C)

When a back-end error signal is received from the internal power stage, the power stage is reset stopping all PWM activity. Subsequently, the modulator waits approximately for the time listed in Table 19 before attempting to re-start the power stage.

Table 19. BKND_ERR Register (0x1C)(1)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION
0	0	0	0	0	0	0	X	Reserved

PWM OUTPUT MUX REGISTER (0x25)

This DAP output mux selects which internal PWM channel is output to the external pins. Any channel can be output to any external output pin.

Bits D21–D20: Selects which PWM channel is output to OUT_A

Bits D17–D16: Selects which PWM channel is output to OUT_B

Bits D13–D12: Selects which PWM channel is output to OUT_C

Bits D09–D08: Selects which PWM channel is output to OUT_D

Note that channels are encoded so that channel 1 = 0x00, channel 2 = 0x01, …, channel 4 = 0x03. **See Figure 51 for details.**

PACKAGING INFORMATION

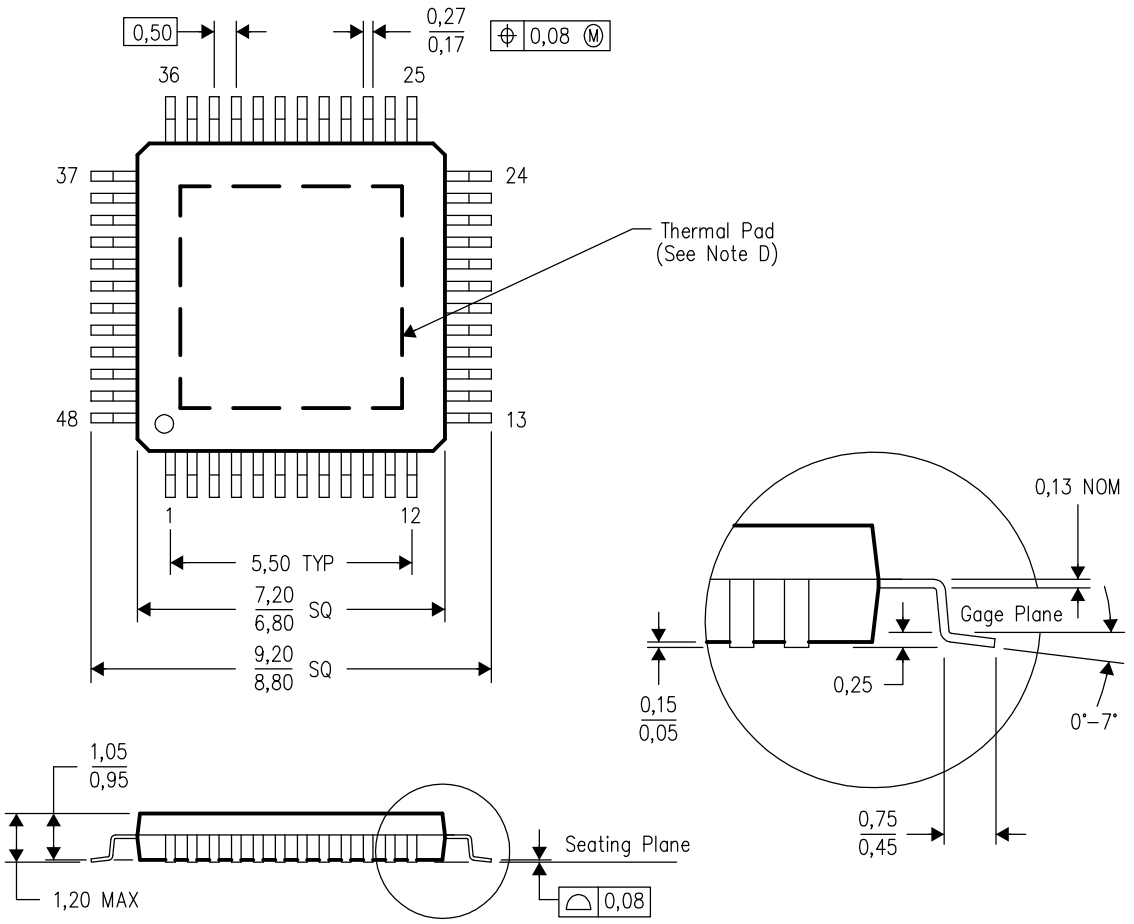
Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)
TAS5711PHP	ACTIVE	HTQFP	PHP	48	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR
TAS5711PHPR	ACTIVE	HTQFP	PHP	48	1000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PHP (S–PQFP–G48) PowerPAD™ PLASTIC QUAD FLATPACK



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <http://www.ti.com>.
E. Falls within JEDEC MS–026

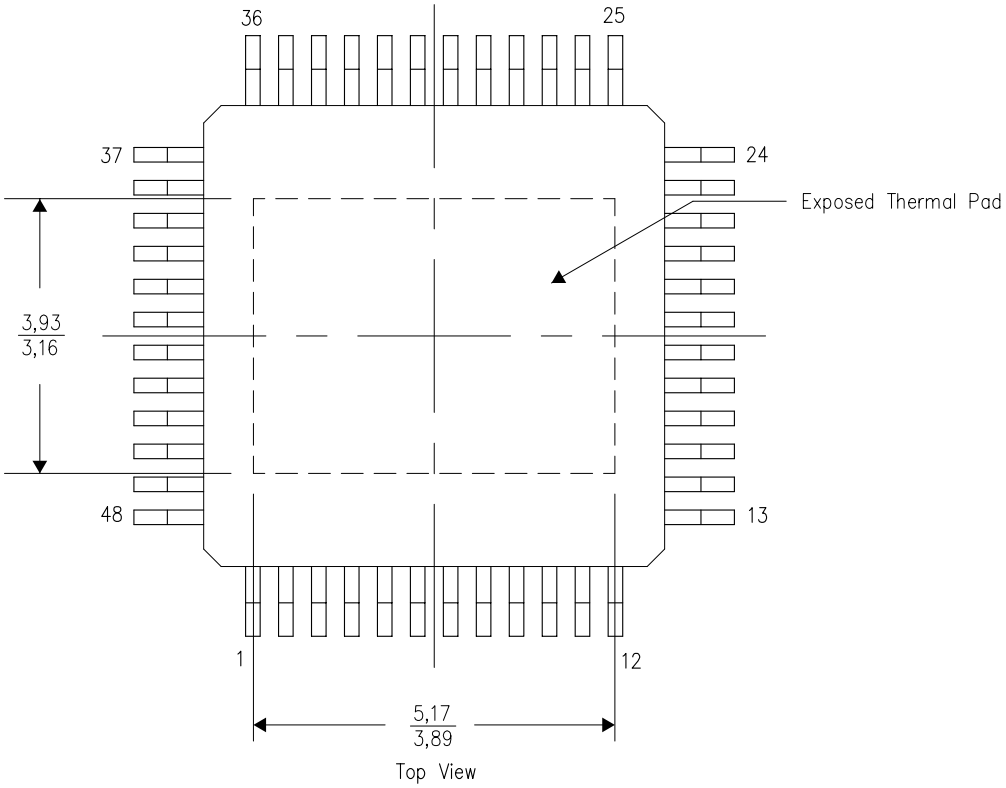
PowerPAD is a trademark of Texas Instruments.

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

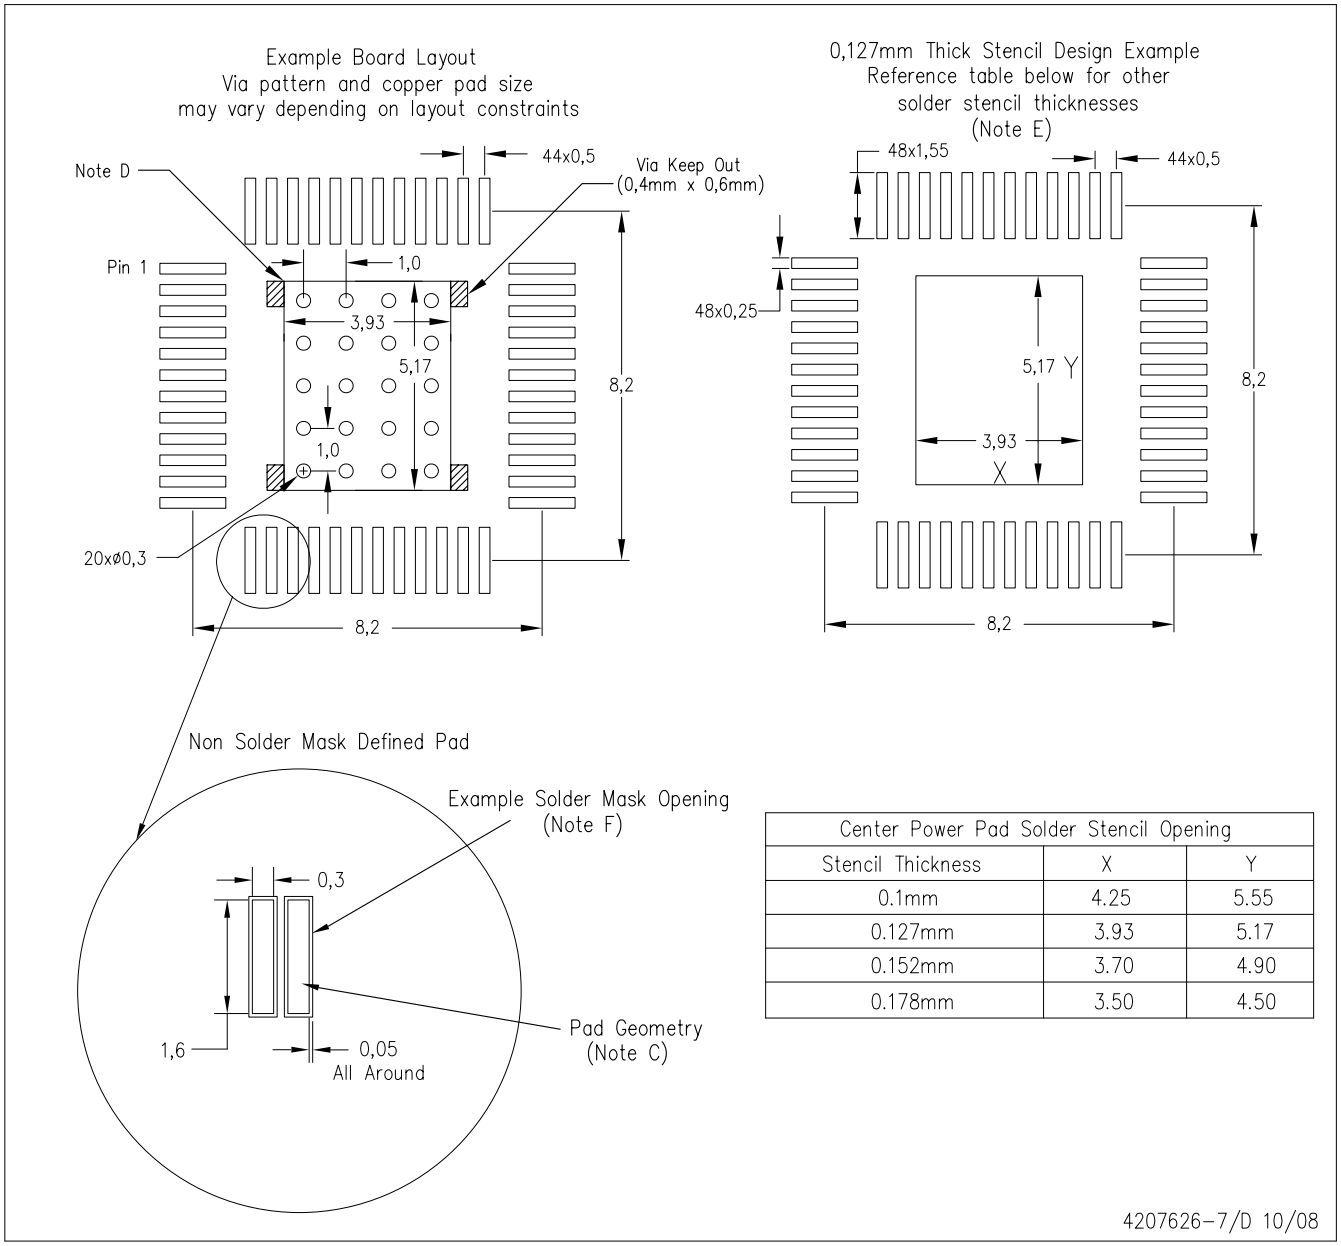
The exposed thermal pad dimensions for this package are shown in the following illustration.



NOTE: All linear dimensions are in millimeters

Exposed Thermal Pad Dimensions

PHP (R–PDSO–G48) PowerPAD™



Center Power Pad Solder Stencil Opening		
Stencil Thickness	X	Y
0.1mm	4.25	5.55
0.127mm	3.93	5.17
0.152mm	3.70	4.90
0.178mm	3.50	4.50

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC–7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting options for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
