BLOCK DIAGRAM

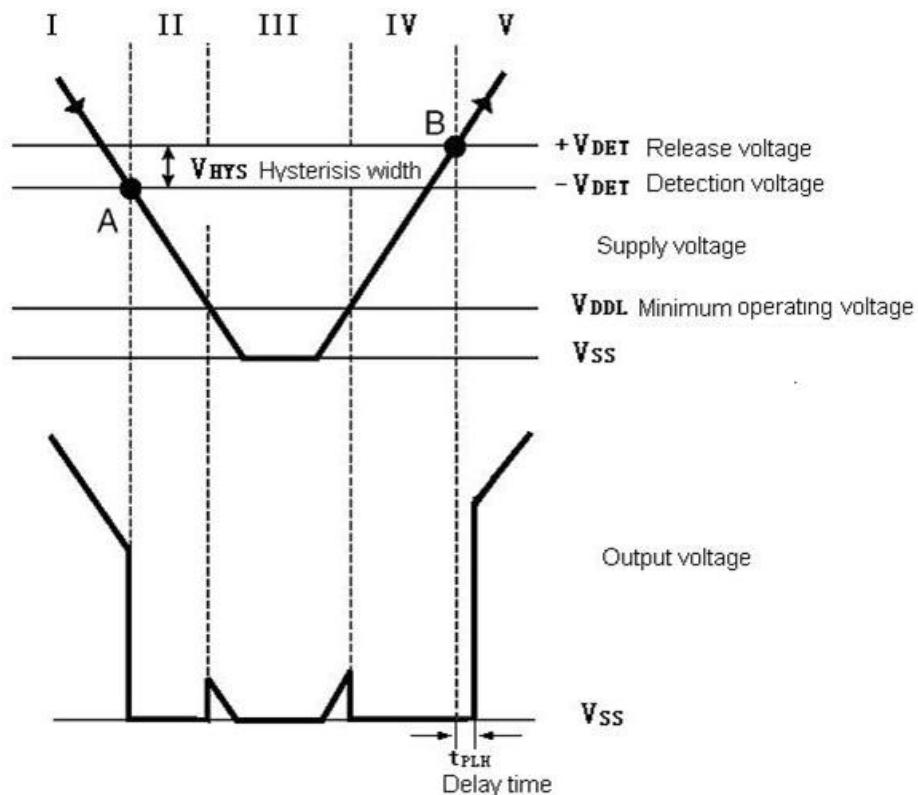

FUNCTION DESCRIPTION

In LC9005, a high precision low temperature coefficient reference voltage is applied to the negative input of a comparator. Input voltage, divided by resistor array of R_a , R_b and R_c , is applied to the positive input of the comparator. Output of the comparator controls a pair of NMOS and PMOS switches, generating the hysteresis. Output of the comparator passes a series of buffer to drive the output NMOS.

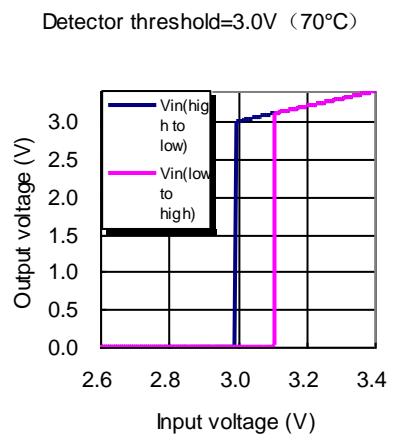

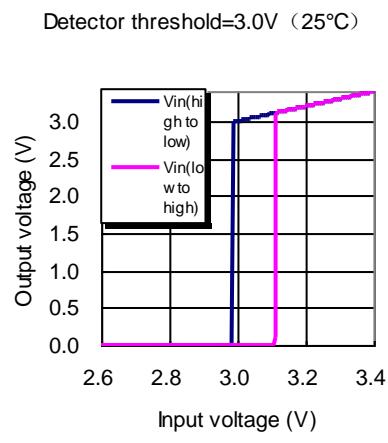

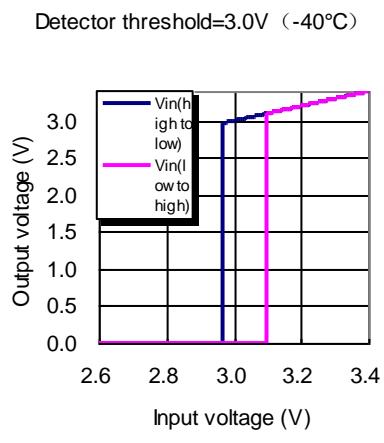

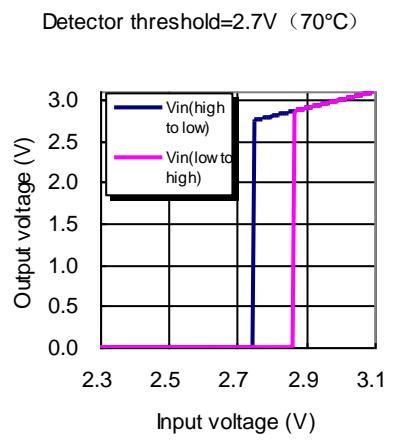

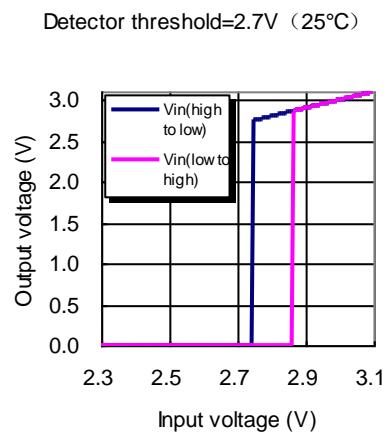

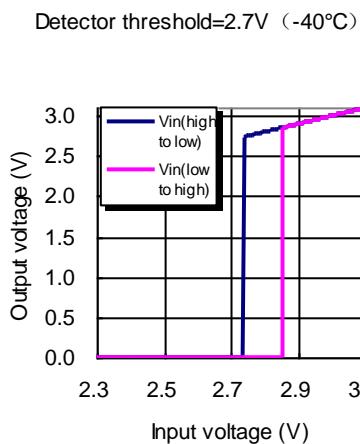

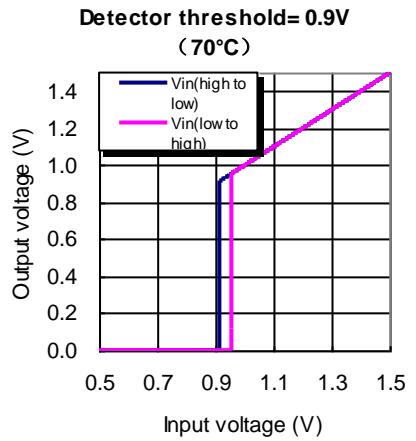

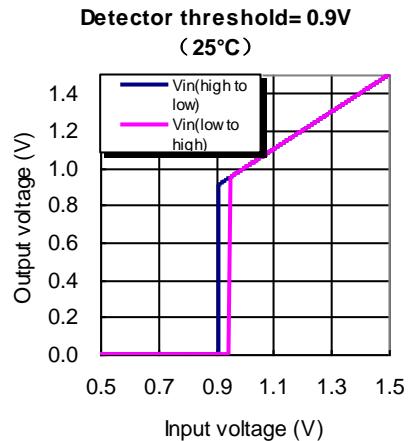

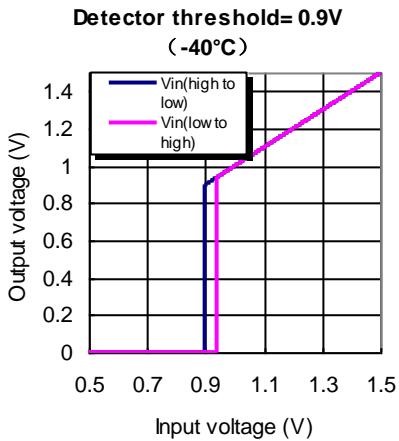

OUTPUT ACTION

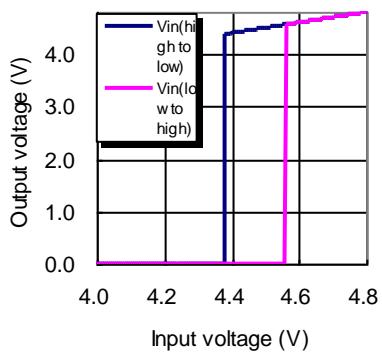

No.	Operation status	Output status
I	VDD>-VDET	Output voltage is equal to the supply voltage
II	VDD drops below - VDET	Output voltage equals to GND level
III	VDD drops further below VDDL	Output voltage is undefined
IV	VDD rises above VDDL	Output voltage equals to GND level
V	VDD rises above + VDET	Output voltage equals to supply voltage, $VHYS=(+VDET)-(-VDET)$
